ABSTRACT

MOSMAN, J. M. & VAN WELZEN, P. C. 2025. Partial north-northwestern Australian origin of the Malesian flora. *Reinwardtia* 24(1): 51–136. — The current study aims to see if a dispersal pathway existed between northern/northwestern Australia and the Lesser Sunda Islands and Southern Moluccas by using distributional data of plants, dated phylogenies and historical biogeography. Dispersal between Asia and Australia has already been shown to exist, especially through Northern Queensland and New Guinea into the Malay Archipelago (Malesia). Taxa occurring in the Northern Territory and Western Australia were compared to taxa present in the Lesser Sunda Islands and Southern Moluccas as a means to explain the origin of part of the Malesian flora. Distribution data of taxa were collected from the Global Biodiversity Information Centre and the database of Naturalis Biodiversity Center, reviewed for accepted names and distribution data via Kew Gardens' Plants of The World Online and dated phylogenies were traced via Google Scholar. The resemblance in genus and species lists between Western Australia/Northern Territory and the Lesser Sunda Islands/southern Moluccas indicates a floral exchange, likely, mainly from Australia to Malesia. Historical biogeographic data were found in only two instances, showing a dispersal to the Lesser Sunda Islands/southern Moluccas around 5 Ma. The conclusion is that this pathway did not result in a major influx of flora into the Malesian area.

Key words: Dated molecular phylogeny, historical biogeography, Lesser Sunda Islands, Malay Archipelago, Moluccas, plant dispersal, Western Australia.

ABSTRAK

MOSMAN, J. M. & VAN WELZEN, P. C. 2025. Sebagian flora Malesia berasal dari Australia utara-barat laut. — *Reinwardtia* 24(1): 51–136. — Penelitian ini bertujuan untuk melihat apakah ada jalur penyebaran antara Australia utara/barat laut dan Kepulauan Sunda Kecil serta Maluku Selatan dengan menggunakan data distribusi tumbuhan, filogeni yang telah diketahui tanggalnya, dan biogeografi historis. Penyebaran antara Asia dan Australia telah terbukti ada, khususnya melalui Queensland Utara dan Nugini ke Kepulauan Melayu (Malesia). Taksa yang terdapat di Teritori Utara dan Australia Barat dibandingkan dengan taksa yang terdapat di Kepulauan Sunda Kecil dan Maluku Selatan sebagai sarana untuk menjelaskan asal sebagian flora Malesia. Data distribusi taksa dikumpulkan dari Pusat Informasi Keanekaragaman Hayati Global dan basis data Pusat Keanekaragaman Hayati Naturalis, ditinjau untuk mendapatkan nama yang diterima dan data distribusi melalui *Plants of The World Online* dari *Kew Gardens* dan filogeni yang diketahui tanggalnya dilacak melalui *Google Scholar*. Kemiripan dalam daftar marga dan jenis antara Australia Barat/Wilayah Utara dan Kepulauan Sunda Kecil/Maluku Selatan menunjukkan adanya pertukaran flora, kemungkinan besar, terutama dari Australia ke Malesia. Data biogeografi historis hanya ditemukan dalam dua contoh, yang menunjukkan penyebaran ke Kepulauan Sunda Kecil/Maluku Selatan sekitar 5 juta tahun lalu. Kesimpulannya adalah bahwa jalur ini tidak mengakibatkan masuknya flora dalam jumlah besar ke wilayah Malesia.

Kata kunci: Australia Barat, filogeni molekuler tertunda, Kepulauan Sunda Kecil, Kepulauan Melayu, Maluku, penyebaran tumbuhan, sejarah biogeografi.

INTRODUCTION

The Malay Archipelago in Southeast Asia, also known as Malesia, consists of the countries of Malaysia, Singapore, Indonesia, Brunei Darussalam, the Philippines, Timor Leste and Papua New Guinea. As a meeting point of the Eurasian-, Pacific-, Philippine sea-, and Indo-Australian plates, it is tectonically one of the most complicated areas in

the world, making it a source of earthquakes and volcanic eruptions. Over millions of years, tectonics in this area have resulted in a total of around 25,000 individual islands. As shown in the next paragraph plant lineages established themselves in Malesia from various directions. Here a possible immigration pathway between Malesian Lesser Sunda Islands and southern Moluccas from north and west Australia is highlighted.

Around 200 Ma the Malay Archipelago did not exist yet, as it, together with parts of Southeast Asia mainland, was attached to the Australian part of Gondwana. It was not until 160 million years ago, during the late Jurassic, that parts of the western half of Malesia and Southeast Asia broke away from Gondwana and started moving northward as microplates (also called terranes), opening up the Tethys III ocean (Audley-Charles *et al.*, 1988). The arrival of these microplates resulted in the formation of SE Asia and W Malesia (including parts of Sulawesi). Around 40 million years ago the Gondwanan continents Antarctica and Australia completely split from one another (Hall, 2013). At the same time microplates, like now forming the Southern Moluccas (SM), the Lesser Sunda Islands (LSI), and the Aru Islands, broke loose from the Sahul Shelf (New Guinea and Australia) and together the eastern half of Malesia and Australia rapidly started moving northward. The collision with the Sunda Shelf caused the Sunda Shelf to slightly rotate counter-clockwise and to partly subduct, elevating the arriving eastern Malesian areas (Hall, 2009; 2013). This resulted in the emergence of the LSI and SM (and the other east Malesian islands) above sea level approximately 5 Ma. The largest LSI and SM islands moved north as the northwestern part of the Australian/New Guinea plate. During the ice ages Australia and New Guinea formed one landmass until the last one ended approximately 8,000 years ago. Then the warming climate caused sea levels to rise, which resulted in the separation of New Guinea and Australia with the formation of the Arafura sea (Kennett *et al.*, 2018). These major events over the past 200 million years created the Malay Archipelago as we know it today.

The Southern Moluccas (SM) are the present-day province of Maluku. These microplates moved north together with the southeastern parts of the Lesser Sunda Islands (the non-volcanic islands Sumba and Timor) with the New Guinea/Australia plate, but are mainly outside the Sahul Shelf. The rest of the Moluccas (Province Maluku Utara) moved from east New Guinea along north New Guinea to their present position (Hall, 2009; 2013). Both provinces also have a partly different flora (Rutgrink *et al.*, 2018). The Aru Islands on the Sahul Shelf should be excluded from SM.

As a phytogeographical region the Malay Archipelago is known as Malesia (van Steenis, 1950; Raes & van Welzen, 2009). During the 19th century Wallace (1860) concluded that Malesia could be divided in an eastern and western half. This division became known as Wallace's line (Fig. 1) and was based on the presence of different mammal and bird groups at both sides of the line (*e.g.*, rodents, deer, monkeys in the west; marsupials, birds of paradise, parrots, crown-pigeons in the east). The line passes east of the Philippines in the

north, between Borneo and Sulawesi in the centre and between Bali and Lombok in the south. Since then, variations, based on different animal or plant groups were published. The most eastern line is Lydekker's line (Lydekker, 1896), running between the Moluccas and New Guinea, and the most western line was independently found by Huxley (Huxley, 1868) and Merrill & Dickerson (Dickerson, 1928), placing the Philippines in the eastern realm (Fig. 1). Simpson (1977) even argues that the Philippines could be considered as a geographic area by itself. The various lines were drawn before a clear understanding (and acceptance) of continental drift and plate tectonics existed. In modern times the species distribution in the Malayan Archipelago is considerably more nuanced (Crayn *et al.*, 2014). Based on plant distributions van Welzen *et al.* (2011) divided Malesia into three areas (see colour shading in Fig. 1), the everwet Sunda Shelf (Malay Peninsula, Sumatra, Borneo, and the SW tip of Java), Wallacea with a more monsoonal climate (rest of Java, Philippines, Sulawesi, Lesser Sunda Islands and Moluccas) and the everwet Sahul Shelf (New Guinea).

All lines are no real borders, especially with plants, many species pass the lines and are present on both sides of the line (van Welzen *et al.*, 2011; Table 2). Therefore, Wallacea is considered a transitional zone between the Sunda and Sahul Shelves, which is contradictory to the original idea of a direct split, as Wallace's line originally suggested (van Welzen *et al.*, 2005; 2011). Still, about a third of the species present in Wallacea is endemic, especially in the Philippines, while about half of the species in Sunda and Sahul is endemic in their respective regions (van Welzen *et al.*, 2005). Within the complete phytogeographical region of Malesia about 70% of the occurring species are endemic (van Welzen *et al.*, 2005; Raes & van Welzen, 2009), species that likely mainly originated in Malesia.

Most microplates moved completely or largely submerged to their present position (Hall, 2009; 2013), which means that the ancestors of the present-day floral lineages must have arrived by immigration. Kooyman *et al.* (2019) mention two major periods of influx (Great Asiatic Floristic Exchanges, GAFIs). GAFI 1, the collision of India with Asia and dispersal via southeast Asia into Malesia, and GAFI 2, the younger collision of the Australian/New Guinea plate with west Malesia. They do not discuss possible pathways (dispersal or migration routes) via which the taxa dispersed. Various pathways are possible. The most important one runs from the mainland of Southeast Asia via the Malay Peninsula to Malesia (often via a branch to Sumatra and one to Borneo) and even up to its eastern edge, New Guinea (mainly GAFI 1 of Kooyman *et al.*, 2019; although a younger interchange with the African flora may have been an

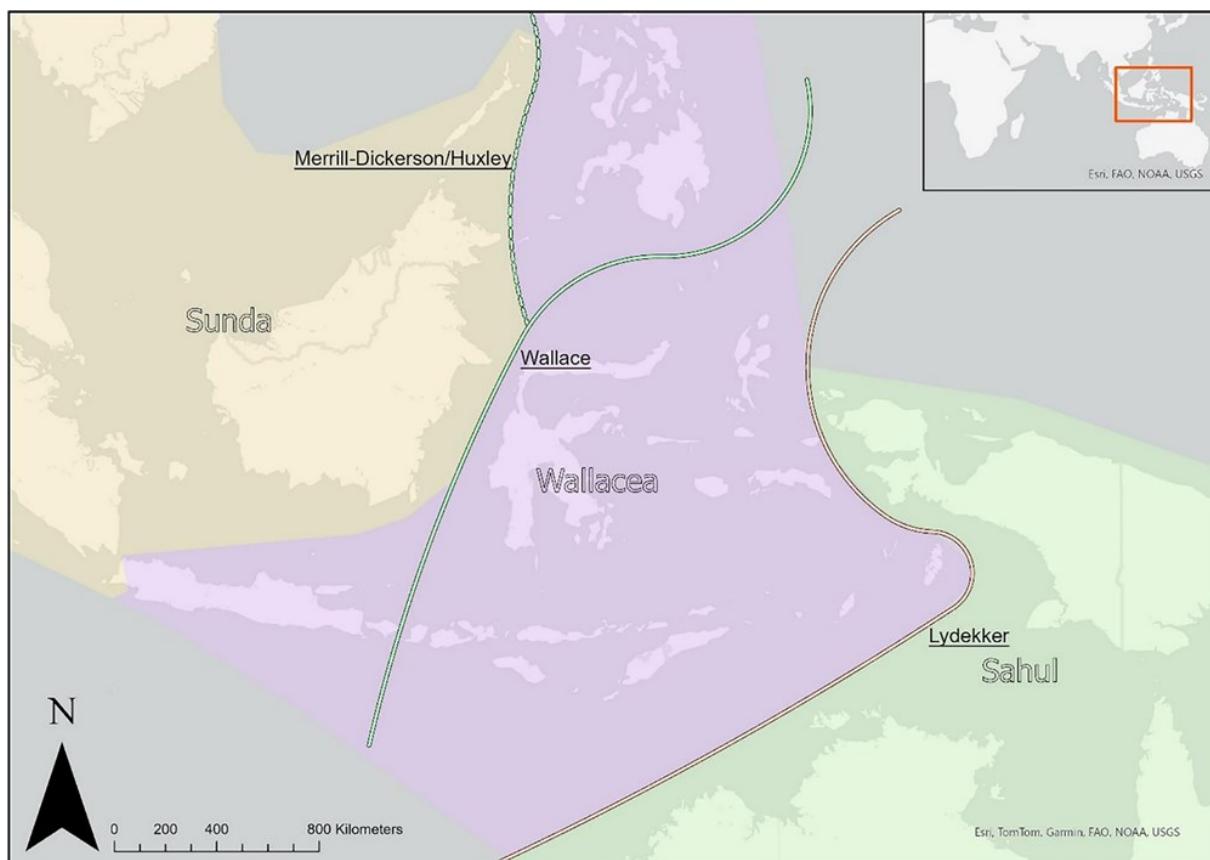

Fig. 1. A map showing the phytogeographical regions of Sunda, Wallacea and Sahul (based on van Welzen *et al.*, 2011), with the Merrill-Dickerson/Huxley line (green dashed line converging with Wallace's line in the south), Wallace's line (green) and Lydekker's line (orange).

additional source; see for the discussion of these Palaeotropical Intercontinental Disjunctions (PIDs) Chantarasuwan *et al.*, 2016 and references therein). This pathway is the oldest in this region and coincides with the timing of the formation of the Malay Archipelago, as 25 million years ago dispersal events started increasing to New Guinea when the Sahul and Sunda shelves started converging (Crayn *et al.*, 2014; Holzmeyer *et al.*, 2023). Another important pathway is from Australian North Queensland and/or to New Guinea to the rest of Malesia (GAFI 2 of Kooyman *et al.*, 2019). This pathway shows dispersal in either direction (*e.g.*, van Balgooy *et al.*, 1996). Another possible pathway is from mainland Southeast Asia via the Philippines, where the eastward moving Palawan could have functioned as a raft, or dispersal via Taiwan occurred. However, this path seems to have been used by a limited number of species (van Welzen *et al.*, 2024).

Within Wallacea, Java and the LSI show an increased dry season when moving from west to east, which is continued in the southern Moluccas. The dryer climate sets the flora of Java and the LSI apart (van Welzen & Slik, 2009). Closest to LSI and SM is the Australian Northern Territory (NT) and Western Australia (WA), both with a dry season. Van Steenis (1979) states that the dispersal from Austra-

lia to the LSI has been a major influx of Australian species into Malesia. Van Steenis (1979) in his Fig. 4, shows two pathways coming from Australia to the Lesser Sunda Islands, the most western one is one-way, from Kimberley to the LSI, the eastern one, bidirectional, between Arnhem Land and the LSI.

The current study aims to investigate a possible pathway from Australia, specifically the regions of WA and NT into the LSI and SM. The relatively close proximity of the LSI/SM to WA/NT, their shared tectonic origin, and a similar relatively dry climate (*e.g.*, van Steenis, 1979: fig. 5; for influence of climate see: Trethowan, 2021, Trethowan *et al.*, 2024), could have allowed for direct dispersal from WA/NT into Malesia without passing through New Guinea first (or the other way around as shown by Joyce *et al.*, 2021). The existence, relevance and timing of this pathway might be determined through existing distributional data, and perhaps via historical biogeography and dated phylogenies.

MATERIAL AND METHODS

A fixed area (box) was drawn according to the WGS84 coordinate system that encloses parts of Western Australia, Northern Territory (WA/NT),

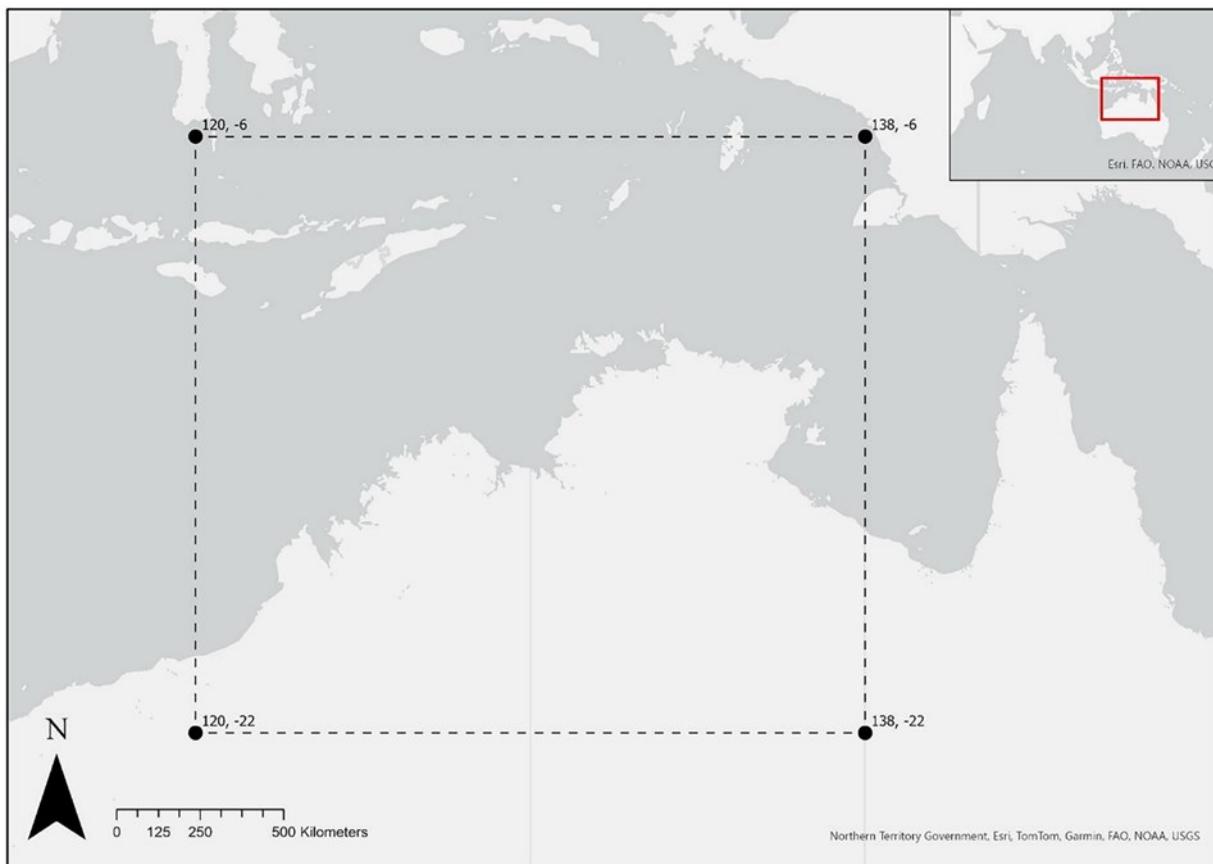

Fig. 2. A map showing the boundaries for which occurrences were collected. Each corner point shows the coordinates that delineate the area.

the Lesser Sunda Islands and the Southern Moluccas (Northern border -6°S , Southern border -22°S , Western border 120°E , Eastern border 138°E) (Fig. 2). This area includes (among many other small islands) the LSI consisting of Flores, Adonara, Lembata, Pantar, Alor, Atauro, Wetar, Timor, Rote, Savu, and Sumba; the Southern Moluccan islands consisting of Leti, Sermata, Babar, Tanimbar, and Aru; and parts of Australia's Northern Territory and Western Australia. The area in the box is a compromise, it should go more northern, eastern and western, but then large non-wanted parts of Australia, New Guinea, Sulawesi and even Borneo would have become included. Adding as much as possible of West Australia added also some desert areas. The idea behind limiting the area in the box is that almost all taxa that dispersed between LSI/SM and WA/NT will be concentrated in the box. A few disjunct species may be missed. Within the box all occurrences of Angiosperms were collected through the Global Biodiversity Information Facility (GBIF; www.gbif.org, last accessed Oct. 2023) and for each record in the resulting lists biogeographical information and accepted names/synonyms were retrieved through Kew Gardens' Plants Of the World Online (POWO; powo.science.kew.org, last accessed Jan.

2024). Two lists were made, a genus and species list, and treated in this way.

The first list was at genus level and consisted of 2,519 records. This list was compiled through data retrieved from GBIF and Naturalis's database for all families of Angiosperms present in the marked location. The second list was at species level and consisted of 6,827 records. Data for this list were only retrieved through GBIF. PWO was used to merge synonyms under the currently accepted names. Taxa that were not present in the desired areas, based on PWO, were filtered out.

Genera or species that are present in WA and/or NT were labelled as 'WA/NT', those present in LSI and/or SM as 'LSI/SM', when present in a combination of these two groups, it was noted as 'both areas'. Western Australia was included in the retrieval of taxa as this is where a large portion of the northern Australian coastline resides. The search for taxa was not restricted to endemic species, all species occurring in the areas, even if much more widespread, were added.

Through the use of Google Scholar (scholar.google.com) dated phylogenies with included biogeographical information were searched for each genus that was present in both WA/NT and the LSI/SM. Search terms used were 'family

Table 1. Numbers and percentages of genera and species in the Lesser Sunda Islands/Southern Moluccas, in Western Australia/Northern Territory, and in both areas.

Region	Number of genera	Percentage	Number of species	Percentage
LSI/SM	443	29.8	953	17.7
WA/NT	530	35.6	3914	72.6
Both	515	24.6	525	9.7
Total	1488	100.0	5392	100.0

Table 2. Two examples of possible dispersal to the Lesser Sunda Islands/South Moluccas from Western Australia/Northern Territory, *Tecticornia* Hook.f. (Amaranthaceae), based on Piirainen *et al.* (2017), and *Schoenus* L. (Cyperaceae), based on Elliott *et al.* (2021).

Species	Distribution	Sister/Ancestral taxon	Distribution	Divergence time
<i>S. sparteus</i>	LSI, New Guinea, Northern Territory, Queensland	<i>S. humilis</i> (sister)	Western Australia	± 5 Ma
		(older ancestral species in Western Australia)		
<i>T. indica</i>	Central Africa, Madagascar, S & SE Asia, Java, LSI, Australia	<i>T. pergranulata</i> (sister)	Australia (both)	± 9.3 Ma
		<i>T. triandra</i> (sister)		± 12 Ma

name', 'genus name', 'dated phylogeny', 'historical biogeography', 'Australia', 'Lesser Sunda Islands', and 'Southeast Asia'.

RESULTS

After the synonyms were updated to the accepted names and non-occurring taxa were removed, the genus list consisted of 1,488 records (Appendix 1) and the species list comprised 5,392 records (Appendix 2). Of the 1,488 genera, 530 (35.6%) were restricted to WA/NT, 443 (29.8%) genera occurred in LSI/SM and 515 (34.6%) genera were present in both areas. Of the 5,392 species, 3,914 (72.6%) occurred in WA/NT, 953 (17.7%) were found in LSI/SM and 525 (9.7%) occurred in both areas simultaneously (Fig. 3; Table 1). It is obvious that the majority of taxa are present in Australia, especially on the species level. This is expected as the Australian area included is much larger than LSI/SM and can harbour more species. There is not much overlap between both areas on the species level (9.7%), but on the genus level are much more even and there is a high overlap (24.6%), which is surprising.

The lists of taxa does not directly indicate exchange between LSI/SM and WA/NT, therefore dated phylogenies were sought. Within the list of 1,488 genera only two instances were found that

show a likely dispersal from WA/NT to LSI/SM (Table 2). The historical biogeography of *Tecticornia* Hook.f. (Amaranthaceae) (Elliott *et al.*, 2021) shows that *T. indica* (Willd.) K.A.Sheph. & Paul G.Wilson (old world, Australia, and LSI) might have dispersed to LSI from Australia as its sister species, *T. pergranulata* (J.M.Black) K.A.Sheph. & Paul G.Wilson, and the sister species to their ancestral species, *T. triandra* (F.Muell.) K.A.Sheph. & Paul G.Wilson, are only present in Australia. *Tecticornia triandra* split off from the ancestor of *T. indica* and *T. pergranulata* ± 12 Ma, and the split between *T. indica* and *T. pergranulata* was ± 9.3 Ma.

For *Schoenus* L. (Cyperaceae) Piirainen *et al.* (2017) show that *S. sparteus* R.Br. (LSI, New Guinea, Northern Territory & Queensland) dispersed to LSI/SM as its sister species, *S. humilis* Benth. and ancestral species on the direct nodes below, show a Western Australian distribution, this dispersal may have occurred ± 5 Ma.

DISCUSSION

The composition of genera and species across LSI/SM and WA/NT shows a very likely floral exchange between WA/NT and LSI/SM as the number of genera and species that occur in both WA/NT and LSI/SM is quite high, 34.6% in gene-

ra (515 genera) and 9.7% in species (525 species) (Table 1; Fig. 3). The numbers of species and genera only serve as an indication as the Lesser Sunda Islands and certainly the southern Moluccas have not been sampled very well (van Welzen & Raes, 2011). Most species predominantly occur in WA/NT (72.6 %, 3,914 spp.), multiple per genus, while in LSI/SM it is generally a single species per genus. This makes it probable that there was mainly exchange from Australia to LSI/SM, otherwise species had to pass through a bottleneck (LSI/SM), followed by a secondary radiation in Australia. Also, the number of shared species and genera is almost equal, indicating that it is more likely a single species per genus that dispersed from WA/NT to LSI/SM (or vicariated between both areas) than the other way round, though that might have happened too. The dispersal routes can only be fully established when far more phylogenies (preferably dated) become available.

Yap *et al.* (2018) established for many woody rainforest species whether they were of Sunda or Sahul origin. Their and our datasets differed strongly and on genus level there was overlap for 161 genera (111 Sunda, 50 Sahul; see last column in Appendix 1), showing the same proportion Sunda/Sahul as reported in Yap *et al.* (2018), 2/3rd Sunda. Indicating mainly an immigration from Sunda to Sahul, which is contrary to what we discussed above. However, Yap *et al.* (2018) did not look at dispersal pathways and concentrated on woody rainforest species only; their dataset likely included mainly taxa that dispersed to N. E. Australia via New Guinea (LSI/SM is a mainly dry area).

Our selection of taxa was based on data from the Naturalis botanic database and cleaned data in GBIF (see Material and Methods). The big advantage of GBIF is that via coordinates one can directly zoom in on the area of interest. Via the reviewers we learned about a checklist of vascular plants for the Sunda to Sahul Shelves, Joyce *et al.* (2020), which, unfortunately, we did not use. The checklist of Joyce *et al.* (2020) could have been used to zoom in on parts of Australia, the Lesser Sunda Islands and the Moluccas. Of the latter, distributions of species had to be checked to only focus on the South Moluccas. We likely missed some species and perhaps also genera. However, if these were not present in GBIF, then the taxa must have been very rare.

The geographical box (Fig. 2) likely also caused incompleteness of all genera and species. However, the high number of taxa present (Appendix 1 & 2) give such a strong signal, that adding missing data will not change this.

Unfortunately, most publications on genera with dated phylogenies and historical biogeography were rare and when available often did not have the necessary information readily available. When

dated information was available, then it often did not show the evolutionary and/or geographic pathway that would indicate direct dispersal/vicariance between WA/NT and LSI/SM, which might be due to a lack of sampling or reflect the general absence of floral exchange between both regions. As a result, only two examples could be found in dated phylogenies that show some kind of dispersal from Australia to LSI/SM.

Schoenus is a cosmopolitan genus that consists of 157 accepted species (POWO). The evolutionary origin of *Schoenus* lays in the Southwestern Australian Floristic Region, which is a large biodiversity hotspot (Hopper & Gioia, 2004; Elliott *et al.*, 2021). *Schoenus sparteus* and its sister taxon *S. humilis* diverged ± 5 million years ago. *Schoenus humilis* is only endemic to Western Australia, just like species ancestral to the two sister species. *Schoenus sparteus* is present in the LSI/SM, New Guinea and in Australia in the Northern Territory and Queensland. *Schoenus sparteus* may have dispersed to Malesia via Cape Atherton and New Guinea or via NT to LSI/SM. No information regarding the dispersal of the species was found.

Tecticornia indica diverged from its sister taxon *Tecticornia pergranulata* around 9.3 million years ago and diverged from the sister taxon of their ancestral species, *Tecticornia triandra*, about 12 million years ago (Shepherd & Wilson, 2007). During this time Australia/New Guinea was still moving up towards the Malay Archipelago, and the Lesser Sunda Islands would not emerge until about 5 million years ago. *Tecticornia indica* is divided into 5 subspecies, which are mostly endemic to Australia; but *T. indica* subsp. *indica* ranges from mostly east African coastal regions to India, Vietnam, the LSI/SM and Northern Australia, and *T. indica* subsp. *ciliolata* (Bunge ex. Ung.-Sternb.) K.A.Sheph. & Paul G.Wilson is endemic to the LSI/SM (POWO). According to Kadereit *et al.* (2005) extant members of Salicornioideae, a subfamily within Amaranthaceae, in which *Tecticornia* is classified, are well adapted to and prefer saline environments. Therefore, it has been hypothesised that an ancestor of *Tecticornia* reached Australia from Eurasia by utilizing the emerging archipelagos as stepping stones during the late Miocene (± 12–5 Ma). The long distance dispersal was likely possible due to the corky and buoyant fruits (e.g., *T. indica*) that are perfectly adapted to float along coastlines or even cross oceans. Salicornioideae almost never occur in humid tropical zones, as the coastal habitats they prefer are often already occupied by mangroves (Kadereit *et al.*, 2006). Australasia is one of the richest mangrove areas in the world, and mangroves are also especially rich around New Guinea. Along the north-western Australian shoreline mangroves are abundant, yet fractured, allowing for *Tectoria* to be present, whereas the entire shoreline of New

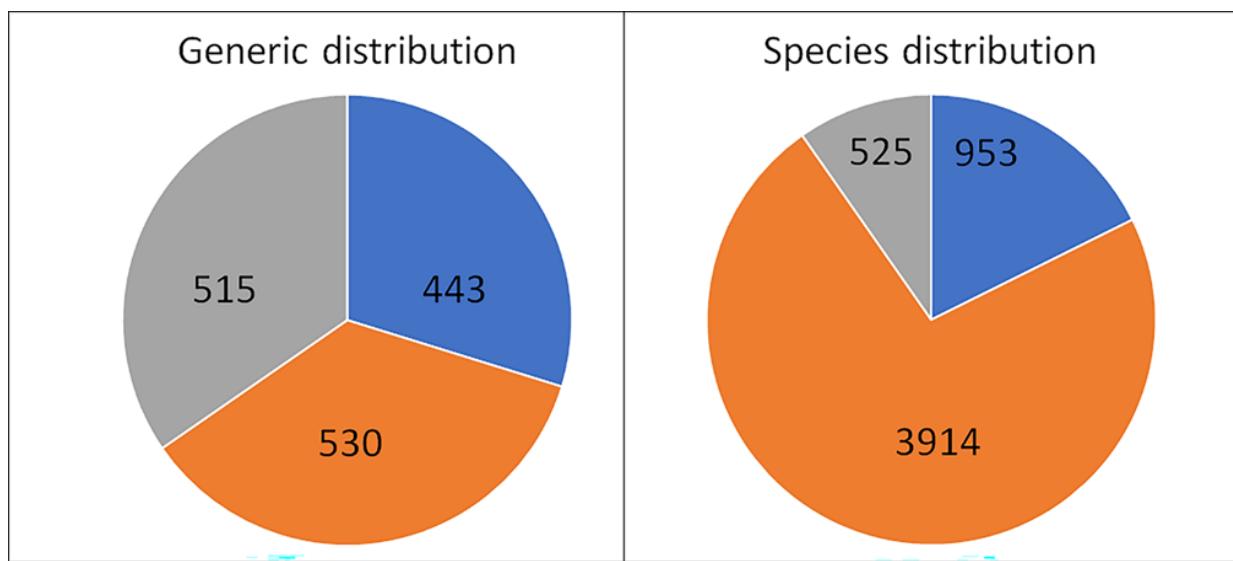

Fig. 3. Numbers of species and genera in Lesser Sunda Island/South Moluccas (blue), Western Australia/Northern Territory (orange) and in both areas (grey).

Guinea has continuous mangrove forests (Duke, 1992). This could explain the lack of *Tecticornia* species on New Guinea.

Both examples indicate that at least 5 Ma dispersal was possible, which is in accordance with geological data (Hall, 2009; 2013). Although this could have happened earlier as the researched part of LSI/SM forms the island arc at the edge of the Australian plate, swooping up continental debris while moving north and thus likely appearing above water earlier.

Kalkman (1955) was one of the first to make an analysis of the flora of the Lesser Sunda Islands (mainly on genus level as most species were not yet well described). According to him 21 genera present in LSI are of Australian (eastern) origin and 30 species. A sharp criterion for establishing an eastern origin was not provided and as most of the genera also occurred in New Guinea a pathway from WA/NT is not always likely. Joyce *et al.* (2021) provide a nice example of dispersal the other way round, *Aglaia elaeagnoidea* (A.Juss.) Benth. (Meliaceae) dispersed from Timor Leste to the Kimberley Plateau of Australia (but also via New Guinea to northeastern Australia via other populations). The phylogeny is not dated, but it is hypothesized that the dispersal may have occurred during glacial maxima in the Quaternary.

A clear dispersal pathway from Northeastern Australia to the Lesser Sunda Islands and Southern Moluccas could not be found due to a lack of historical biogeographical data, but there is indirect evidence for such a pathway as shown by the distributions of genera (Appendix 1) and species (Appendix 2). However, it is not clear if the dispersal to LSI/SM was followed by dispersal further into Malesia. Marsh *et al.* (2009) indicated a connection between LSI and the Moluccas and Sulawesi, however, this is due to not splitting Java into

an everwet southwestern part and the dry monsoonal rest, now Java groups with the ever wet Sunda Shelf islands, otherwise the monsoonal part of Java connects to the LSI (van Welzen *et al.*, 2011). The pathway between LSI/SM and WA/NT was likely not important for two reasons. The islands closest to Australia are small and can thus harbour a limited number of species (e.g., MacArthur & Wilson, 1967; Trethowan, 2021; especially lowland species less surface available; Trethowan *et al.*, 2024) and they will act as a bottle neck in plant dispersal. At least the LSI show a Javanese flora that becomes more depauperate when moving east due to the more severe dry monsoon (van Welzen & Slik, 2009; van Welzen *et al.*, 2011), which also means, regarding the sizes of the islands and their mature flora, that it will be difficult for immigrating species to establish themselves; they will certainly not have established in high numbers. Trethowan *et al.* (2023) showed another filter, ‘smaller fruits increase plant species occurrence on islands with a greater relative amount of their landmass at higher elevation’ (Trethowan *et al.*, 2023), which is the case in LSI/SM, meaning that dispersal of species with large(r) fruits occurs less. Trethowan *et al.* (2024) also established a link between increased precipitation seasonality and a decrease in tree species.

CONCLUSION

Unlike the statement by van Steenis (1979), it is highly unlikely that migration from WA/NT to LSI/SM resulted in a major influx of taxa in Malesia. The influx that occurred is difficult to estimate, far more dated phylogenetic and historical biogeographic data are needed before the importance of this possible pathway will become clear.

ACKNOWLEDGEMENTS

The first author is thankful to Naturalis Biodiversity Center for arranging his internship and he likes to thank the HAS Green Academy tutoring his progress. We like to thank all institutes that contributed data to GBIF. We are also grateful to the two reviewers, an anonymous reviewer and Liam Trethowan, who helped us to improve our manuscript enormously.

APPENDIX 1. List of genera that either occur in the Lesser Sunda Islands/Southern Moluccas (LSI/SM; blue), Western Australia/Northern Territory (WA/NT; orange) or in both (black). The locality is based on POWO (<https://powo.science.kew.org>). Authors are omitted to save space. The last column shows the origin of the genus according to Yap *et al.* (2018), Sunda in black, Sahul in red, both in green.

Family	Genus	Locality	Origin	Family	Genus	Locality	Origin
Acanthaceae	<i>Acanthus</i>	Both areas		Amaranthaceae	<i>Didymanthus</i>	WA/NT	
Acanthaceae	<i>Asystasia</i>	Both areas		Amaranthaceae	<i>Dissocarpus</i>	WA/NT	
Acanthaceae	<i>Avicennia</i>	Both areas		Amaranthaceae	<i>Dysphania</i>	WA/NT	
Acanthaceae	<i>Barleria</i>	LSI/SM		Amaranthaceae	<i>Enchytraea</i>	WA/NT	
Acanthaceae	<i>Dicladanthera</i>	WA/NT		Amaranthaceae	<i>Eremophea</i>	WA/NT	
Acanthaceae	<i>Dicliptera</i>	Both areas		Amaranthaceae	<i>Gomphrena</i>	Both areas	
Acanthaceae	<i>Hemigraphis</i>	LSI/SM		Amaranthaceae	<i>Hemicroa</i>	WA/NT	
Acanthaceae	<i>Hygrophila</i>	Both areas		Amaranthaceae	<i>Maireana</i>	WA/NT	
Acanthaceae	<i>Hypoestes</i>	Both areas		Amaranthaceae	<i>Malacocera</i>	WA/NT	
Acanthaceae	<i>Isoglossa</i>	LSI/SM		Amaranthaceae	<i>Neobassia</i>	WA/NT	
Acanthaceae	<i>Justicia</i>	Both areas		Amaranthaceae	<i>Omegandra</i>	WA/NT	
Acanthaceae	<i>Lepidagathis</i>	LSI/SM		Amaranthaceae	<i>Osteocarpum</i>	WA/NT	
Acanthaceae	<i>Nelsonia</i>	WA/NT		Amaranthaceae	<i>Ouret</i>	LSI/SM	
Acanthaceae	<i>Pararuellia</i>	LSI/SM		Amaranthaceae	<i>Ptilotus</i>	Both areas	
Acanthaceae	<i>Pseuderanthemum</i>	LSI/SM		Amaranthaceae	<i>Pupalia</i>	LSI/SM	
Acanthaceae	<i>Rostellularia</i>	Both areas		Amaranthaceae	<i>Roycea</i>	WA/NT	
Acanthaceae	<i>Ruellia</i>	WA/NT		Amaranthaceae	<i>Rumicastrum</i>	WA/NT	
Acanthaceae	<i>Staurogyne</i>	Both areas		Amaranthaceae	<i>Salicornia</i>	WA/NT	
Acanthaceae	<i>Strobilanthes</i>	LSI/SM		Amaranthaceae	<i>Salsola</i>	Both areas	
Acanthaceae	<i>Thunbergia</i>	Both areas		Amaranthaceae	<i>Sclerolaena</i>	WA/NT	
Achariaceae	<i>Pangium</i>	LSI/SM		Amaranthaceae	<i>Suaeda</i>	WA/NT	
Achariaceae	<i>Ryparosa</i>	LSI/SM		Amaranthaceae	<i>Surreya</i>	WA/NT	
Acoraceae	<i>Acorus</i>	LSI/SM		Amaranthaceae	<i>Tecticornia</i>	Both areas	
Actinidiaceae	<i>Saurauia</i>	LSI/SM		Amaranthaceae	<i>Threlkeldia</i>	WA/NT	
Aizoaceae	<i>Carpobrotus</i>	WA/NT		Amaryllidaceae	<i>Crinum</i>	Both areas	
Aizoaceae	<i>Disphyma</i>	WA/NT		Amaryllidaceae	<i>Proiphys</i>	Both areas	
Aizoaceae	<i>Gunnyopsis</i>	WA/NT		Amphorogynaceae	<i>Choretrum</i>	WA/NT	
Aizoaceae	<i>Sesuvium</i>	Both areas		Anacardiaceae	<i>Blepharocarya</i>	WA/NT	Sunda
Aizoaceae	<i>Tetragonia</i>	WA/NT		Anacardiaceae	<i>Buchanania</i>	Both areas	Sunda
Aizoaceae	<i>Trianthema</i>	Both areas		Anacardiaceae	<i>Dracontomelon</i>	LSI/SM	
Aizoaceae	<i>Zaleya</i>	Both areas		Anacardiaceae	<i>Mangifera</i>	LSI/SM	
Alismataceae	<i>Butomopsis</i>	WA/NT		Anacardiaceae	<i>Pleiogynium</i>	LSI/SM	Sahul
Alismataceae	<i>Damasonium</i>	WA/NT		Anacardiaceae	<i>Rhus</i>	LSI/SM	Sunda
Alismataceae	<i>Limnophyton</i>	LSI/SM		Anacardiaceae	<i>Semecarpus</i>	LSI/SM	Sunda
Amaranthaceae	<i>Achyranthes</i>	Both areas		Anacardiaceae	<i>Spondias</i>	LSI/SM	
Amaranthaceae	<i>Allmania</i>	LSI/SM		Annonaceae	<i>Artobotrys</i>	LSI/SM	
Amaranthaceae	<i>Alternanthera</i>	Both areas		Annonaceae	<i>Cananga</i>	LSI/SM	Sunda
Amaranthaceae	<i>Amaranthus</i>	Both areas		Annonaceae	<i>Desmos</i>	Both areas	
Amaranthaceae	<i>Atriplex</i>	WA/NT		Annonaceae	<i>Huberantha</i>	WA/NT	
Amaranthaceae	<i>Blitum</i>	WA/NT		Annonaceae	<i>Meiogyne</i>	WA/NT	
Amaranthaceae	<i>Chenopodium</i>	WA/NT		Annonaceae	<i>Miliusa</i>	Both areas	Sunda
Amaranthaceae	<i>Cyathula</i>	LSI/SM		Annonaceae	<i>Mitraphora</i>	LSI/SM	
Amaranthaceae	<i>Deeringia</i>	Both areas

APPENDIX 2. List of species that either occur in the Lesser Sunda Islands/Southern Moluccas (LSI/SM; blue), Western Australia/Northern Territory (WA/NT; orange) or in both (black). Authors are omitted to save space.

Family	Species	Locality (POWO)	Family	Species	Locality (POWO)
Acanthaceae	<i>Acanthus ebracteatus</i>	Both areas	Acanthaceae	<i>Strobilanthes renschiae</i>	LSI/SM
Acanthaceae	<i>Acanthus ilicifolius</i>	Both areas	Acanthaceae	<i>Strobilanthes timorensis</i>	LSI/SM
Acanthaceae	<i>Asystasia gangetica</i>	Both areas	Acanthaceae	<i>Thunbergia arnhemica</i>	WA/NT
Acanthaceae	<i>Asystasia nemorum</i>	LSI/SM	Acanthaceae	<i>Thunbergia hastata</i>	LSI/SM
Acanthaceae	<i>Asystasia oppositiflora</i>	LSI/SM	Acanthaceae	<i>Thunbergia pleistodonta</i>	LSI/SM
Acanthaceae	<i>Avicennia alba</i>	Both areas	Achariaceae	<i>Pangium edule</i>	LSI/SM
Acanthaceae	<i>Avicennia integra</i>	WA/NT	Acoraceae	<i>Acorus calamus</i>	LSI/SM
Acanthaceae	<i>Avicennia marina</i>	Both areas	Actinidiaceae	<i>Saurauia schmutzii</i>	LSI/SM
Acanthaceae	<i>Avicennia officinalis</i>	Both areas	Actinidiaceae	<i>Saurauia verheijenii</i>	LSI/SM
Acanthaceae	<i>Barleria prionitis</i>	LSI/SM	Aizoaceae	<i>Carpobrotus modestus</i>	WA/NT
Acanthaceae	<i>Brunoniella acaulis</i>	WA/NT	Aizoaceae	<i>Carpobrotus virescens</i>	WA/NT
Acanthaceae	<i>Brunoniella australis</i>	WA/NT	Aizoaceae	<i>Gunniopsis zygophylloides</i>	WA/NT
Acanthaceae	<i>Brunoniella linearifolia</i>	WA/NT	Aizoaceae	<i>Sesuvium portulacastrum</i>	Both areas
Acanthaceae	<i>Dicladanthera forrestii</i>	WA/NT	Aizoaceae	<i>Tetragonia coronata</i>	WA/NT
Acanthaceae	<i>Dicliptera armata</i>	WA/NT	Aizoaceae	<i>Tetragonia tetragonoides</i>	WA/NT
Acanthaceae	<i>Dicliptera arnhemica</i>	WA/NT	Aizoaceae	<i>Trianthema compactum</i>	WA/NT
Acanthaceae	<i>Dicliptera australis</i>	WA/NT	Aizoaceae	<i>Trianthema cussackianum</i>	WA/NT
Acanthaceae	<i>Dicliptera ciliata</i>	Both areas	Aizoaceae	<i>Trianthema glossostigma</i>	WA/NT
Acanthaceae	<i>Dicliptera glabra</i>	LSI/SM	Aizoaceae	<i>Trianthema kimberleyi</i>	WA/NT
Acanthaceae	<i>Dicliptera miscella</i>	WA/NT	Aizoaceae	<i>Trianthema megaspernum</i>	WA/NT
Acanthaceae	<i>Dicliptera spicata</i>	Both areas	Aizoaceae	<i>Trianthema oxycalyptrum</i>	WA/NT
Acanthaceae	<i>Hygrophila angustifolia</i>	Both areas	Aizoaceae	<i>Trianthema patellitectum</i>	WA/NT
Acanthaceae	<i>Hygrophila difformis</i>	WA/NT	Aizoaceae	<i>Trianthema pilosum</i>	WA/NT
Acanthaceae	<i>Hypoestes floribunda</i>	Both areas	Aizoaceae	<i>Trianthema portula-</i> <i>castrum</i>	LSI/SM
Acanthaceae	<i>Hypoestes polythyrsa</i>	LSI/SM	Aizoaceae	<i>Trianthema rhynchoca-</i> <i>lypnum</i>	WA/NT
Acanthaceae	<i>Hypoestes sparsiflora</i>	WA/NT	Aizoaceae	<i>Trianthema triquetrum</i>	Both areas
Acanthaceae	<i>Isoglossa dichotoma</i>	LSI/SM	Aizoaceae	<i>Trianthema turgidifolium</i>	WA/NT
Acanthaceae	<i>Justicia gendarussa</i>	LSI/SM	Aizoaceae	<i>Trianthema ufoense</i>	Both areas
Acanthaceae	<i>Lepidagathis humifusa</i>	LSI/SM	Aizoaceae	<i>Zaleya galericulata</i>	Both areas
Acanthaceae	<i>Nelsonia canescens</i>	WA/NT	Alismataceae	<i>Albidella acanthocarpa</i>	WA/NT
Acanthaceae	<i>Pararuellia napifera</i>	LSI/SM	Alismataceae	<i>Albidella oligococca</i>	LSI/SM
Acanthaceae	<i>Rostellularia ascendens</i>	WA/NT	Alismataceae	<i>Butomopsis latifolia</i>	WA/NT
Acanthaceae	<i>Ruellia bracteata</i>	WA/NT	Alismataceae	<i>Damasonium minus</i>	WA/NT
Acanthaceae	<i>Ruellia primulacea</i>	WA/NT	Amaranthaceae	<i>Achyranthes aspera</i>	Both areas
Acanthaceae	<i>Staurogyne spathulata</i>	WA/NT	Amaranthaceae	<i>Achyranthes bidentata</i>	LSI/SM
Acanthaceae	<i>Strobilanthes apoensis</i>	LSI/SM	Amaranthaceae	<i>Allmania nodiflora</i>	LSI/SM
Acanthaceae	<i>Strobilanthes arborea</i>	LSI/SM			
Acanthaceae	<i>Strobilanthes bremekampiana</i>	LSI/SM			
Acanthaceae	<i>Strobilanthes crispa</i>	LSI/SM			
Acanthaceae	<i>Strobilanthes filiformis</i>	LSI/SM			

Family	Species	Locality (POWO)	Family	Species	Locality (POWO)
Amaranthaceae	<i>Alternanthera angustifolia</i>	WA/NT	Amaranthaceae	<i>Dysphania rhadinostachya</i>	WA/NT
Amaranthaceae	<i>Alternanthera denticulata</i>	WA/NT	Amaranthaceae	<i>Dysphania simulans</i>	WA/NT
Amaranthaceae	<i>Alternanthera sessilis</i>	Both areas	Amaranthaceae	<i>Dysphania sphaerosperma</i>	WA/NT
Amaranthaceae	<i>Amaranthus centralis</i>	WA/NT	Amaranthaceae	<i>Dysphania truncata</i>	WA/NT
Amaranthaceae	<i>Amaranthus cochleitepalus</i>	WA/NT	Amaranthaceae	<i>Enchytraea tomentosa</i>	WA/NT
Amaranthaceae	<i>Amaranthus cuspidifolius</i>	WA/NT	Amaranthaceae	<i>Eremophea spinosa</i>	WA/NT
Amaranthaceae	<i>Amaranthus induratus</i>	WA/NT	Amaranthaceae	<i>Eriochiton sclerolaenoides</i>	WA/NT
