

in the monographic revisions. It was also decided to defer discussions on the merits and suppression of species to the final revision.

ALSEODAPHNE Nees

Alseodaphne khasyana (Meissn.) Kosterm., *comb. nov.*

Machilus khasyana Meissner (basonym) in DC, Prodr. 15(1) : 42. 1864; Kostermans, Bibl. 911 no 48. 1964. — Typus: *Griffith 125* (= *U26U K.D.*), Khasya (K).

This species, which for a century was only known from one collection, has now been collected again.

W. BURMA. North Triangle, Hkinlum, alt. 1200 m, big tree in the gorge of Hkrang Hka, April, young fr., *Kingdon Ward 20661* (BM, K); Sumprabum, alt. 1000 m, March, fr., *Kingdon Ward 220U3* (BM, K), infructescence dense, up to 9 cm long, fruit 3.7 cm long, bright green (immature), polished, pedicels 10—12 mm long, swollen, 3—5 mm in diam., at apex 4—8 mm wide, leaves somewhat glaucous below.

Alseodaphne oblanceolata (Merr.) Kosterm., *comb. nov.*

Beilschmiedia oblanceolata Merrill (basonym) in Univ. Calif. Publ. Bot. 15: 84. 1929; Kostermans, Bibl. 140 no 170. 1964. — Typus: *Elmer 20894, 20931*.

BEILSCHMIEDIA Nees

Beilschmiedia gynotrochioides Kosterm., *spec. nov.*

Arbor in omnibus partibus glabris inflorescentiis exceptis ramulis strictis laevis nitidis foliis oppositis coriaceis oblongis obscure sensim acuminatis vel obtusis basi cuneatis utrinque laxè prominule reticulatis supra nervo mediano impresso costis filiformibus prominulis subtus nitidus nervo mediano prominulo laeve verruculato costis subpatentibus filiformibus prominulis utrinque 8—12 marginem versus arcuatis petiolis conspicuis supra subcanaliculatis laeve verruculatis paniculis axillares ramulis brevissimis patentibus paucifloris sparse minutissime pulverulente pilosis.

TYPUS: *Chai S 18908* (L).

Tree, 20 m high, 20 cm diam., bark hoopmarked, dark brown and grey-mottled, smooth; all parts glabrous (except inflorescence); branchlets smooth, glossy, black (dried), stiff. Leaves opposite, coriaceous, oblong, 3 x 9—4 x 13 cm, shortly, gradually acuminate or obtuse, base cuneate; both surfaces glossy, laxly, prominulously reticulate; upper surface with impressed midrib and very slender, prominulous ribs; lower surface with somewhat prominent, verruculate midrib; lateral nerves 8—12 pairs, rather patent, very slender, near the margin arcuate, prominulous. Petioles 10—15 mm long, verruculate, above subcanaliculate. Panicles axillary,

narrow, up to 7 cm long, few-flowered, few and short, patent branches (up to 5 mm long), towards apex minutely, sparsely, pulverulently pilose. Flowers 3 mm in diam., tepals ovate, acute, concave, 2 mm, yellow (fresh); stamens 1—1.5 mm long; anther elongate ovate, merging into the very short, broad filament, provided with 2 large, sessile glands; outer stamens introrse, inner ones lateral; staminodes heart-shaped, acute, 0.5 mm; ovary glabrous; style short; stigma inconspicuous.

Resembles somewhat *Gynotrochus* or *Pellacalyx* of Rhizophoraceae.

SARAWAK. Bt. Raya, Kapit, hillside, mixed *Dipterocarp* forest, clay rich, shale derived soil, alt. 600 m, Nov., fl., *Chai S 18908* (L).

Beilschmiedia oblonga Kosterm., *spec. nov.*

Arbor ramulis apicem versus minutissime dense ferrugineo pulverulente pilosis ramis gracilis glabris griseis foliis alternantibus glabris chartaceis oblongis obtusis vel apiculatis basi cuneatis utrinque laxè prominule reticulatis supra nervo mediano costisque prominulis subtus nervo mediano subprominentibus costis utrinque ca 8 (5—9) erecto-patentibus gracilibus prominulis marginem versus arcuatis petiolis gracilis glabris longis paniculis brevis axillares dense ferrugineo minute lanuginosis paucifloris vix ramosis floribus pro genere magnis.

TYPUS: *bb 31807* (L).

Tree, branchlets towards apex minutely, densely, pulverulently rusty pilose; branches slender, glabrous, greyish, smooth. Leaves spirally arranged, glabrous, chartaceous, oblong, 4 X 9—4.5 x 11 cm, obtuse or apiculate, base cuneate, both surfaces laxly, prominulously reticulate; upper surface with prominulous midrib and ribs; lower surface with prominent midrib, lateral nerves ca 8 (5—9) pairs, slender, erect-patent, arcuate and running out towards the margin. Petioles slender, glabrous, 15—22 mm, cylindrical. Panicles axillary, hardly branched, densely, minutely rusty, lanuginose, up to 2.5 cm long, peduncle and branches slender. Flowers relatively large, densely, minutely, rusty lanuginose; tepals elongate ovate, 3—3.5 mm long; pedicels up to 3 mm long.

W. INDONESIAN BORNEO. Melawi, Tjatit, Melaban R. and Gurung Ulur R. divide, alt. 280 m, April, fl., *bb 3180V* (BO, L).

Beilschmiedia phoebeopsis Kosterm., *spec. nov.*

Arbor ramulis crassis apicem versus dense minutissime rufo sublanuginosis foliis aggregatis coriaceis obovato-ellipticis obtusis vel apiculatis basi acutis supra nitida glabra laevia nervis principalis impressis subtus pallida mox glabra nervo mediano valde prominentibus costis utrinque ca 8 suberecto arcuatis prominentibus axillis excavatis nervis secundariis parallelis laxis prominulis rete laxè prominulis petiolis longis

dense pilosis supra plana vel subcanaliculata inflorescentiis axillaris longe pedunculatis dense minutissime ferrugineo sublanuginosis ramulis paucis brevis fructus immaturus globosus.

TYPUS: *Ashton S 16551* (L).

Tree, 17 m high with low buttresses; bark greyish brown and grey lichen-mottled, smooth; branches stout with large, round, protruding leaf scars, at apex densely, minutely, rusty sublanuginose. Leaves clustered near the apex of the branchlets, coriaceous, stiff, obovate-elliptical, 7 x 18—11 x 23 cm, obtuse or very shortly apiculate-acuminate, base acute; upper surface glabrous (except the sunken midrib), glossy, smooth, main nerves impressed; lower surface paler (glaucous when fresh), soon glabrous (except on the main nerves), midrib strongly prominent, lateral nerves ca 8 pairs, rather erect, arcuate, prominent, axils excavate; secondary nerves prominulous, parallel, lax; reticulation lax, prominulous. Petioles densely, minutely, rusty sublanuginose, 15—30 mm long, flat or slightly channeled above. Inflorescences axillary, densely, minutely, rusty sublanuginose, consisting of a long peduncle (up to 16 cm) and an upper part of up to 5 cm with few, short (up to 1 cm) rather slender branches. Immature fruit globose, apiculate.

SARAWAK. Bintulu, Ulu Stirau, Labang, mixed Dipterocarp forest, alt. 20 m, yellow sandy clay, March, young fr., *Ashton S 16551* (K, L), leaves bluish green below with yellowish nerves.

***Beilschmiedia podagrica* Kosterm., spec. nov.**

Arbor magna ramulis cylindricis glabris foliis alternantibus glabris coriaceis vel chartaceis late ovato-ellipticis usque ad lanceolatis apice acuminatis vel sensim acuminatis basi cuneatus supra nitida laevia nerviis principalis prominulis subtus subopacis laevia vel sub lente obscure reticulatis nervo mediano prominentibus costis utrinque 4—7 suberectis arcuatis marginem versus arcuatim evanescentibus petiolis longis supra applanatis glabris; inflorescentiis strictis parvis axillaris vel terminalis obscure minutissime pilosis vix ramosis infructescentiis glabris non-ramosis strictis fructus globosus pedunculis parvis subincrassatis.

TYPUS: *Hartley NGF 12398* (L).

Large tree, 17—33 m high, 90—120 cm in diam.; outer bark dark brown or grey brown, slightly rough with many, shallow fissures; inner bark straw; sapwood yellow; heartwood lightbrown. Buttresses up to 1.5 m high, out 3 m, thick 5 cm. Branchlets glabrous, smooth or with few lentils, upper part subangular. Leaves spirally arranged, the upper ones sub-opposite; leafbuds grey, glossy, crusty; the flush densely, very minutely, adpressed pilose. Adult leaves glabrous, coriaceous or chartaceous, ovate-elliptical to lanceolate, 3.5 X 11—9.5 X 15 cm (in the specimen *Clemens 711* up to 16 x 20 cm), apex shortly acuminate or (in the narrow leaves) gradually acuminate, tip sharp, base contracted into the petiole, shortly

cuneate; upper surface glossy, primary nerves smooth, prominulous; lower surface more dull, smooth or obscurely, laxly reticulate; midrib prominent; lateral nerves prominent, 4—7 pairs, erect-patent, slightly arcuate towards margin where they run out arcuately; secondary nerves filiformous, lax, or invisible. Petioles glabrous, 2—3 cm long, flat above, broadened near the apex. Inflorescences axillary and sub-terminal, stiff, coarse, hardly branched (branches erect) with a lax, very minute (under high power lens) tomentum of adpressed hairs, up to 3 cm long. Flowers not present. Outer stamen 1/3 mm long, anther elongate-ovate, 2-celled, filament short, laxly pilose. Fruit globose, smooth, 12 mm diam. on a short thick, slightly enlarged peduncle, not differentiated from the infructescence branch.

One is tempted to refer this species to *Dehaasia*, because of the thick fruit peduncle, but the peduncles are not swollen and fleshy as in *Dehaasia*; moreover the virgate inflorescence points to *Beilschmiedia*. The straw coloured inner bark and the yellow sapwood point again to *Dehaasia*. Complete flowers are needed.

The sterile specimen *Clemens 711* has enormous leaves, but is in other respects certainly conspecific. The Biak specimen is a low altitude one.

TERRITORY OF NEW GUINEA. Morobe Distr., Sattelberg-, jungle above the mission, alt. 1100 m, ster., *Clemens 711* (A); E. Highlands, 2 miles W. of Omaura, alt. 2000 m, Nov., fr., *Hartley TGH 12.398* (L); ibid., July, young fr., *Hartley TGH 11962* (L). PAPUA. S. Highlands Distr., near Tag-e, lake Kutubu, alt. 900 m, tree 08 m, bole 25 m, diam. 55 cm., ster., *Schodde 2167* (L), vernacular name "Masa" (Kutubu language); this name also used for *Cryptocarya hartleyi* Kosterm. W. IRIAN. Isl. Biak, near Mansforbo, alt. 55 m, ster., *BW 9658* (L).

CINNAMOMUM Sch.

***Cinnamomum cordatum* Kosterm., spec. nov.**

Arbuscula vel frutex in omnibus partibus glabris inflorescentiis exceptis ramulis angulatis foliis oppositis rigide coriaceis cordiformis apex obtusis vel late obscure obtuseque acutis basi cordatis supra laevia nerviis majoribus vix conspicuis subtus laevia nervo mediano prominulo nerviis basalibus incurvatis adscendentibus; infructescentiis axillaris foliis subaequilongis cupula obconica parte basali minutissime adpresse pilosa.

TYPUS: *Symington C.F. 32130* (K).

Shrub or treelet up to 7 m high, glabrous in all its parts except the inflorescence; branchlets smooth, glossy, angular. Leaves opposite, stiffly coriaceous, heartshaped, 2 x 3—4.5 x 6 cm, apex obtuse or obtusely obscurely acutish, base cordate; upper surface smooth, nerves hardly visible; lower surface smooth, midrib prominulous, the two main basal nerves starting from the petiole insertion, arcuately ascending to 3/4 the leaf blade length, lower down one pair of short, obscure accessory basal nerves;

lateral nerves none or a single one near the top quart of the leaf. Petiole thick, 4—5 mm long. Infructescences axillary, stiff, almost glabrous and unbranched, up to 5 cm long; fruit cup obconical, 1 cm long with remnants of tepals at the rim, minutely adpressed pilose towards the base.

Resembles *C. sessilifolium* Kanehira.

MALAY PENINSULA. Mt. Korbu (Kerbau) on open ridge tops above 1500 m, July, fr., *Symington C. F. 32130* (K, KEP); Frasers Hill, ridge beyond Pahang Bungalow, Sept., fr., *Symington F.D. 33231* (KEP).

***Cinnamomum rosselianum* Kosterm., spec. nov.**

Arbor mediocris in omnibus partibus glabris ramulis gracilibus nitidis atris (in sicco) foliis coriaceis suboppositis vel alternantibus utrinque nitidis dense prominuli areolatis breve late acuminatis basi cuneatis nervo mediano supra prominulo costis filiformibus prominulis subtus nervo mediano prominulis costis utrinque 5—8 filiformibus erecto-patentibus marginem versus arcuatim conjunctis petiolis pergracilis longis inflorescentiis axillaris parvis paucifloris vix ramosis tepalibus ovatis acutis antheris 4-locellatis exterioribus antheribus triangulari-ovatis introrsis filamentis sublatis aequilongis interioribus aequilongis antheris brevioribus extrorsis filamentis basin versus laterioribus brevioribus glandulis filamentis adnatis epibasalibus staminodiis conspicuis stipitatis ovario glabro stylo aequilongo stigmate truncato.

TYPUS: *Brass 281+19* (K).

Canopy tree, 6—8 m high, glabrous in all its parts; branchlets very slender, glossy, black (in sicco). Leaves subopposite and spirally arranged, coriaceous, ovate-elliptical, 1.5 x 3—3.5 X 6.5 cm, broadly, shortly acuminate, base cuneate, both surfaces glossy, densely, minutely, prominently areolate, upper surface with prominent midrib and very slender, prominent ribs, lower surface glaucous (fresh), midrib prominent, lateral nerves 5—8 pairs, filiformous, erect-patent, near the margin connected arcuately. Petioles very slender, 1—1.5 cm long. Inflorescences axillary, slender, few-flowered, up to 2 cm long, few-branched, branches up to 1 cm long. Tepals ovate-acute, 2—2.5 mm long; stamens equal, somewhat shorter than the tepals, outer ones with 4 ovate-oblong, introrse cells (the upper cells smaller), anthers as long as the rather broad filaments; inner anthers 2-celled, extrorse, smaller than the outer ones on filaments which are much broadened at base because of the adnate, small, stipitate glands; apex with a broad, sterile part; staminodes triangular-cordate, acute, stipitate; ovary glabrous, slightly sunk into the receptacle, as long as the style with truncate inconspicuous stigma. Fruit ellipsoid, 1 X 1.5 cm, apiculate; cup thin, flattish, 7 mm diam./; pedicel 8 mm, slightly ofconical.

ROSSEL ISLAND. S. slopes, canopy tree frequent in low scrubby forest of a ridge crest, alt. 700 m, fls. yellow, fr. unripe, *Brass 28410* (BM, K, L).

Cryptocarya alticola Kosterm., *spec. nov.*

Arbor ramulis strictis griseo-scabiosis ramis dense lenticellatis foliis alternantibus crasse coriaceis junioribus minutissime dense rufo lanuginosis adultis glabris ellipticis vel oblanceolatis obtusis vel obscure late acuminatis basi cuneatis supra nitida nervo mediano piano costis graciles impressis nervis secundariis obscuris subimpressis, subtus opacis nervo mediano lato prominulo costis utrinque 6—9 erecto-patentibus marginem versus arcuatim evanescentibus nerviis secundariis parallelis per laxis obscuris reticulato deest petiolis conspicuis paniculis terminalis perdense minutissime fusco-rubro pulverulente pilosis.

TYPUS: *Hoogland and Pullen 615U* (L).

Tree, 28 m high; free bole 13 m, diam. 40 cm; bark ca. 11 mm thick, grey-brown with numerous longitudinal cracks, partly pustular; inner bark yellow-straw; wood straw. Branchlets stiff, covered with tiny white scabs, covering a very dense, extremely minute tomentum; branches with numerous, pale, small lenticels. Leaves spirally arranged, rigidly coriaceous, elliptical to oblanceolate, 2.5 x 5—4 X 9.5 cm, top obtuse or obscurely

shortly, broadly acuminate, base cuneate; upper surface glossy, midrib and the slender lateral nerves impressed, secondary nerves obscure, impressed; lower surface dull, in very young leaves with a very dense, minute, rusty lanuginose tomentum, often covered by grey, glossy scabs; adult leaves smooth, glabrous, midrib broad, prominulous, lateral nerves erect-patent, slightly arcuate, running out arcuately near the margin; secondary nerves faint, distant, parallel, prominulous. Petioles 10—15 mm long, flat above. Panicles multi-flowered, dense, terminal, up to 14 cm long, ramifications erect, stiff, lower ones up to 9 cm long; ultimate branchlets and flowers covered with a dark rusty, minute, subpulverulent, dense tomentum; flowers 4 mm long.

Related perhaps to *Cr. obovata* R. Br., which has fewer lateral nerves, different flowers and different tomentum.

TERRITORY OF NEW GUINEA. W. Highlands Distr., near Tomba village, S. slope of Mt. Hagen Range, alt. 2550 m, common tree, flowers fragrant, perianth reddish brown, stamens yellow, *Hoogland & Pullen 6154* (L).

***Cryptocarya atra* Kosterm., spec. nov.**

Cryptocarya archboldiana Allen in J. Arn. Arb. 23: 143. 1942, p.p. quoad spec. *Brass & Versteegh 131,19*.

Arbor ramulis glabris subangulatis sulcatis atris ramis saepe minute pustulatis foliis alternantibus glabris coriaceis subovato-ellipticis breve caudato-acuminatis basi in petiololum contractis supra nitida nervo mediano impresso costis filiformibus subimpressis subtus pallidiora in foliis adultis glabris, obscure reticulatis nervo mediano prominentibus costis utrinque 3—5 erecto-patentibus, adscendentibus, arcuatis prominentibus nerviis secundariis parallelis laxis prominulis petiolis gracilis canaliculatis. Paniculis terminalis glabris crassis, laxis rigidis foliorum longioribus fructus subovoideo-ellipsoideus glabris vix costatis.

TYPUS: *Brass & Versteegh 13119* (L).

Tree, 25—30 m high, 47 cm diam.; bark 19 mm thick, black, scaly, rough; wood brown. Branchlets glabrous, smooth, black, sulcate, subangular; in the flush the branchlets densely minutely aureo-sericeous. Leaves spirally arranged, coriaceous, subovate-ellipsoid, 1.8 X 3.5—4 X 8 cm, abruptly caudate-acuminate, acumen ca 5 mm long, base contracted into the 7—10 mm long, glabrous slender petiole; upper surface smooth (in the specimen *Brass & Versteegh 13562* obscurely, laxly reticulate), midrib impressed, lateral nerves filiformous, subimpressed; lower surface in young leaves minutely, densely sericeous; adult ones glabrous, midrib prominent, lateral nerves 3—5 pairs, erect-patent, arcuate, prominent, ascendent, connected by subhorizontal, parallel, lax secondary nerves. Petiole sulcate above. Infructescences terminal, stiff, thick, glabrous, up to 8 cm, broad; branches few, thick, stiff; fruit subovoid-ellipsoid, up to 12 x 15 mm, smooth or obscurely ribbed.

Very near to *Cr. sleumeri*, but this has much larger leaves which are in adult stage glabrous.

W. IRIAN. Idenburg R. 4 km S. W. of Bernhardcamp, alt. 850 m, March, fr., *Brass & Versteegh 131,19* (L); *ibid.*, alt. 225 m, ster., *Brass & Versteegh 13562* (A, L).

***Cryptocarya aurea* (Kosterm.) Kosterm., comb. nov.**

Endiandra aurea Kostermans (basionym) in Bull. bot. Gard. Buitenzorg, Ser. 3, 18: 442. 1950; *Bibl. Laur.* 483 no. 7. 1964.

Specimens examined: W. IRIAN. Arfak Mts., Angi Gita lake, ca 1800 m, small tree, up to 8 m high, Oct., buds, *Kostermans 2014* (= *bb 33649*), 2027, 2033, 2038, 2143, 2196, 233U (BO, L).

***Cryptocarya aureosericea* Kosterm., spec. nov.**

Arbor ramulis perdense minutissime adpresse pilosis, foliis alternantibus chartaceis late ellipticis vel subovato lanceolatis apice distincte acuminatis basi cuneatis supra mox glabra venis vix conspicuis subtus perdense aureo-sericea nervo mediano prominentibus costis utrinque 7 prominentibus suberecto-patentibus sensim arcuatis reticulatio laxe prominulo conspicuo; paniculis axillaris terminalisque dense sericeis floribus sessilibus dense sericeis.

TYPUS: *Whitmore's Coll. BSIP 3643* (L).

Tree, up to 30 m high and 60 cm in diam. Bole blackish brown, smooth, rugulose with fine vertical lines of lenticels, sometimes some hoop marks. Buttresses equal, thin and plankish, steep, up to 1.5 m. Slash: bark pink fawn with dark brown fibres set in discrete radial files; bark almost black near surface; wood yellowish fawn, soft, white, yellow within. Crown small with upturned limbs, flattish, diffuse, rather yellowish green. Branchlets with a minute dense layer of sericeous, yellowish brown hairs, branchlets often with transverse irregular raised bumpy rings, lenticels few, conspicuous. Leaves spirally arranged, chartaceous, broadly elliptic to ovate-lanceolate (in *BSIP H37*), up to 9 X 17 cm (4.5 X 12 cm in *BSIP 1437*); apex abruptly acuminate (in the ovate-lanceolate leaves the apex is less abruptly acuminate), acumen slender, up to 1 cm long, base cuneate, slightly tapered; young leaves golden sericeous on both surfaces; adult ones soon glabrous on the upper surface with hardly prominent slender main nerves; lower surface densely aureo-sericeous, midrib rather broad, prominent; lateral nerves 7 pairs, patent, rather erect, gradually arcuate, prominent, running out towards the margin; reticulation lax, faint. Petioles ca 1 cm long, sericeous. Panicles axillary and terminal, few-branched, up to 12 cm long; flowers sessile, densely sericeous; bracts caducous.

DISTRIBUTION: N. E. New Guinea, Solomon Isl.

Cryptocarya borneensis Kosterm., *spec. nov.*

Cryptocarya kurzii Hk. f. var. *subsericea* Airy Shaw in Kew Bull. 1939: 535.
— Typus: Richards 2U3 (K).

Arbor ramulis strictis dense minutissime rufo vel griseo sericeis foliis alternantibus coriaceis ellipticis acuminatis basi acutis supra glabra nitida nervo mediano piano subtus dense minutissime sericea nervo mediano prominentibus costis utrinque 6—7 suberectis prominulis paullo curvatis reticulatis obscuro petiolis longis paniculis axillaris terminalibusque dense minutissime aureo-sericeis densifloris foliis multo brevioribus fructus ellipsoidas laevibus nitidus.

TYPUS: SAN 16257 (L).

Tree, 20 m high; branchlets straight, rather slender, stiff, densely, minutely rusty or grey sericeous. Leaves spirally arranged, coriaceous, elliptical, 2.5 X 6—5 X 11 cm, distinctly acuminate, base acute; upper surface smooth, glossy, glabrous, except the flat midrib; lower surface densely, minutely sericeous, midrib prominent, lateral nerves prominent, rather erect, slightly arcuate, 6—7 pairs, reticulations rather obscure. Petioles slender 8—14 mm long, somewhat flattened above. Panicles narrow, axillary or terminal, densely, minutely golden sericeous, many-flowered, 3—5 cm (axillary) long; flowers circa 2.5—3 mm, sericeous, tube slender. Fruit ellipsoid, smooth, glossy, up to 9 X 14 mm.

Cryptocarya carrii Kosterm., *spec. nov.*

Arbor ramulis glabris gracilis in sicco nigris vel griseis foliis alternantibus chartaceis glabris (domatiis exceptis) ovato-lanceolatis acuminatis basi in petiolum gracilem contractis utrinque minute prominule areolatis nerviis majoribus supra prominulis in depressis subtus prominentibus costis utrinque 3 basalibus adscendentibus paniculis latis axillaribus terminalibusque dense flavo subadpresso pilosis pilis substrigosis floribus pilosis.

TYPUS: *Carr 14960* (L).

Tree, branchlets slender, glabrous, black (in sicco), smooth, towards apex densely, yellowish-grey, adpressed pilose. Leaves spirally arranged, chartaceous, almost glabrous, ovate-elliptical, 3.5 x 7—6 x 12 cm, apex acuminate with sharp tip, base contracted into the slender, 5—7 mm long, glabrescent, above channeled petioles, rounded or shortly cuneate; both surfaces densely, minutely, prominulously areolate, upper surface often smooth with filiform, slightly impressed main nerves; lower surface with prominent main nerves (sometimes with a few hairs near its base), lateral nerves 3 pairs, erect-ascending, arcuate, the lower pair subbasal, reaching 2/3 of the leafblade length, axils pilose. Panicles broad, many-flowered, axillary and terminal, up to 10 cm long, densely, minutely, dirty yellowish sub-adpressed pilose, the hairs rather strigose; flowers with a similar indumentum, 1.5 mm long.

TERRITORY OF NEW GUINEA. Boridi, secondary forest, alt. 1100 m, Nov., fl., *Carr 14960* (A, L).

Cryptocarya cordifolia Kosterm., *spec. nov.*

Arbor mediocris ramulis crassis minutissime ferrugineo sublanuginosis foliis alternantibus chartaceis magnis late ellipticis apice obtusis vel subemarginatis basi cordatis supra mox glabra laevia nerviis primariis prominulis subtus (in sicco) pallidioribus venis minute tomentellis nervo mediano magno dense puberulo prominente costis utrinque 17—19 patentibus strictis prominentibus marginem versus arcuatim evanescentibus reticulo laxo prominulo; petiolis brevis magnis; paniculis axillaribus perdense minutissime ferrugineo pilosis multifloris.

TYPUS: *Womersley NGF 17617* (L).

Tree, 8 m high, bole 3 m, 15 cm diam. Branchlets thick, densely, minutely ferrugineous-sublanuginose; terminal bud densely rusty tomentellous. Leaves spirally arranged, chartaceous, 16 X 30—20 x 37 cm, apex obtuse or subemarginate, base auriculate-cordate; upper surface soon glabrous, smooth midrib and lateral nerves hardly prominulous, lower surface paler (in sicco), midrib stout, strongly prominent, densely, minutely, rusty-woolly; lateral nerves 17—19 pairs, patent (except the erect-patent apical ones), prominent, straight, arcuate and running out near the margin; secondary and tertiary nerves prominulous, forming a rather lax reticulation; all veins minutely pilose. Petioles stout, densely, minutely rusty-pilose, 10—15 mm long. Panicles axillary, densely, minutely rusty pilose; branches few, manyflowered; flowers broad with ovate tepals.

Belongs with *Cr. magnifolia* Teschn. to the largest-leaved *Cryptocarya* species.

TERRITORY OF NEW GUINEA. Morobe Distr., Bumbu valley logging Rd., 10 miles from Lae, April, fl., *Womersley NGF 17617* (L).

Cryptocarya endiandraefolia Kosterm., *spec. nov.*

Arbor mediocris ramulis gracilibus glabris apicem versus minutissime dense pulverulente pilosis foliis alternantibus chartaceis glabris oblongis breve acuminatis basi acutis supra nitida laevia nervo mediano impresso costis filiformibus obscuris subtus opaca dense minutissime reticulata, nervo mediano prominentibus costis utrinque 7—9 gracilibus prominulis erecto-patentibus subarcuatis petiolis distinctis inflorescentiis axillaribus terminalibusque dense minutissime subadpresse ferrugineo pilosis.

TYPUS: *Hoogland 5131* (L).

Tree, 10 m high, 15 cm diam.; bark 5 mm thick, pale grey-brown, shallowly longitudinally fissured; inner bark pale brown; wood straw; branchlets slender, glabrous, towards apex densely, minutely, rusty pilose. Leaves spirally arranged, chartaceous, glabrous, oblong, 2.5 x 7—3.5 x 11 cm, apex shortly acuminate, base acute; upper surface smooth, midrib impressed, lateral nerves very slender, rather obscure; lower surface densely, very minutely reticulate; midrib prominent; lateral nerves 7—9 pairs, slender, erect-patent, slightly arcuate. Petioles 1—1.5 cm long, slender. Panicles axillary and terminal, dense, many flowered, up to 4 (axillary), 7 (terminal) cm long, densely, minutely sub-adpressed pilose. Flowers 1.5 mm long.

TERRITORY OF NEW GUINEA. Madang Distr., S. W. foothills of the Finisterre Mts, near Gurumbu village, alt. 750 m in tall, secondary forest, occasional, Aug., fl., *Hoogland 5151* (L); Sepik Distr., Wewak Angoram area, alt. 30 m, July, fl., *Pullen 1369* (L), leaves with longer acumen.

Cryptocarya erectinervia Kosterm., *spec. nov.*

Arbor ramulis glabris strictis saepe sulcatis apicem versus minutissime pulverulente pilosis foliis alternantibus coriaceis glabris ellipticis breve acuminatis vel subobtusis basi subrotundatis vel breve acutis supra nitida sublaevia nervo mediano costisque impressis subtus opaca laevia nervo mediano valde prominentibus costis utrinque 6—8 suberectis strictis prominentibus ad marginem arcuatis petiolis longis nee sulcatis paniculis axillaribus terminalibusque multifloris dense minute subadpresse pilosis.

TYPUS: *Kostermans 9908* (L).

Tree 20 m high, bole 12 m, diam. 60 cm; buttresses 50 cm high, out 50 cm; bark smooth, light brown, 0.5 mm; living bark 8 mm, light brown, inside paler; wood white with sweetish smell. Branchlets glabrous, glossy, yellowish grey or white, often sulcate, near apex minutely, pulverulently pilose. Leaves spirally arranged, coriaceous, glabrous, elliptical to subovate-elliptical, 3 X 11—6.5 x 20 cm, apex obtuse or shortly acuminate, base rounded, rarely shortly acute; upper surface glossy, smooth or obscurely, very densely, minutely reticulate, main nerves impressed; lower surface dull, smooth or (in the enumerated specimens) densely, minutely reticulate, the secondary veins more conspicuous, midrib strongly prominent; lateral nerves 6—8 pairs, rather erect, straight, prominent, at margin arcuate. Petioles up to 1.5 cm long, slender, flat or somewhat concave above. Panicles axillary and terminal, manyflowered, up to 10 cm long, densely, yellowish brown subadpressed pilose.

Cryptocarya filicifolia (Kosterm.) Kosterm., *comb. nov.*

Beilschndedia filicifolia Kostermans (basonym) in *Reinwardtia* 5: 346, fig. 6. 1960.

Material with immature flowers, proves this to belong to *Cryptocarya*.

Additional material: WEST IRIAN. Bele R., 18 km N. E. of Lake Habbema, Nov., buds, Brass & Versteegh 11132 (BO, L), common tree of primary forest, 2400 m alt., tree 27 m, diam. 41 cm, crown not wide spreading, bark 10 mm thick, wood rose, fl. buds yellow green; Idenburg R., 18 km S. W. of Bernhard Camp, ster., Brass & Versteegh 12509 (L), rare tree on slope of ridge, 25 m high, 45 cm diam., bark black, rough, wood brown, leaves up to 4 X 16 with 20 and more pairs of patent, lateral nerves.

Cryptocarya fluminensis Kosterm., *spec. nov.*

Arbor humilis in omnibus partibus glabris floribus perparce minutissime pilosis exceptis foliis alternantibus papyraceis subobovato-vel subovato-ellipticis vel elongato ellipticis -brevissime acuminatis vel subobtusis basi rotundatis utrinque obscure laxe prominule reticulatis supra nervo mediano piano costis filiformibus vix prominulis vel subimpressis subtus nervo mediano prominente costis utrinque 7—9 erecto-patentibus vix arcuatis prominentibus paniculis axillaris gracilibus multifloris floribus parvis.

TYPUS: *Lam 7716* (L).

Tree, up to 8 m high; bark blackish or dark purplish brown with short and shallow, longitudinal fissures and round, brown lenticels; inner bark straw-brown; wood straw; branching horizontal, but not whorled, glabrous in all its parts, except the minutely, scantily pilose flowers. Branches slender, smooth, cylindrical. Leaves spirally arranged, papery, subobovate- to subovate-elliptical to elongate elliptical, 6 x 15—8 x 22 cm, top very shortly acuminate, subobtuse, base rounded; both surfaces obscurely, laxly reticulate; upper surface with flat midrib, ribs slender slightly impressed or prominent; lower surface with prominent midrib, lateral nerves 7—9 pairs, erect-patent, rather straight, prominent, curved

near margin. Petiole cylindrical, 8—13 mm long. Panicles axillary, slender, many-flowered, up to 8 cm long, the lower branches up to 2 cm long; flowers 1—1.5 mm long.

PAPUA. Near Port Moresby, E. of Brown R., alt. 25 m, Sept., fls. white, *Lam 7716* (A, L); ibid., alt. 200 m, Aug., fl., *Womersley & Lam NGF 6240* (L); Tufi Distr. near Budi Barracks, alt. 75 m, tree 4 m, leaves up to 10 X 46 cm, panicles up to 15 cm, *Hoogland 1586* (L); Laloki R., 15 miles E. of Port Moresby, alt. 30 m, Sept., buds, *Schodde 3071* (L).

CRYPTOCARYA FORBESII Gamble

Cf. Kostermans, I.e. 401 no. 99. 1964. — Typus: *Forbes 640*.

New synonym: *Cryptocarya myrdoides* Moore; cf. Kostermans, I.e. 421 no. 208. 1964. — The type specimen of this (*Forbes 410*) has smaller leaves, but conforms in all other respects.

Antares, alt. 2360 m, July, fl., *Kalkman 4451* (L).

Cryptocarya gigantocarpa Kosterm., *spec. nov.*

Arbor ramulis crassis dense pulverulente rufo pilosis foliis alternantibus coriaceis late ellipticis apice acuminatis (?) basi in petiolum crassum contractis supra glabra nervo mediano (basin excepta) costisque et nerviis secundariis impressis, subtus glabra, nerviis pilosis exceptis, pallidioribus; nervo mediano costisque utrinque 7—9 suberectis valde prominentibus reticulatio valde prominentibus perconspicuis. Infructescentiis axillaribus foliis brevioribus crassis, fructus subglobosus magnis pedicellis brevis crassis obconicus.

TYPUS: *Versteegh BW 7482* (L).

Tree, 20 m high, bole ca 12 m, diam. 35 cm.; outer bark greyish brown, not or longitudinally fissured; inner bark orange-brown within; slash pink

or straw; branchlets stout, covered by a dense, pulverulent, rusty tomentum. Leaves spirally arranged, coriaceous, broadly elliptical, up to 11 x 24 cm; top not present any more, perhaps shortly acuminate, base rounded; upper surface, glabrous with impressed main nerves (except base of midrib); lower surface paler (in sicco), glabrous, but for the tomentellous nerves and veins; midrib strongly prominent; lateral nerves 7—9 pairs, rather erect, arcuate and running out near the margin; secondary nerves prominent, lax, parallel, tertiary and quaternary nerves forming a prominent reticulation. Petioles stout, up to 15 mm long. Infructescence axillary, hardly branched, stout, 5 cm long; fruit globose, brown, roughish, 4.5 cm in diam., pedicel obconical, 5 mm long and 5 mm in diam.

DISTRIBUTION: New Guinea, lowlands.

TERRITORY OF NEW GUINEA. Morobe Distr., between Busu and Butibun R., 10 miles N. of Lae, alt. 100 m, March, fl., *Hartley TGH 11348* (L), inflorescences up to 6 cm long, densely, minutely, yellow pilose, hardly branched, fls. sessile, broad, densely pilose, 2.5 mm high. WEST IRIAN. Near Manokwari, Momi, low, after fruiting, *Kostermans 216* (= 66 33424) (BO, L); et *171* (= 66 33392), ster. (BO, L), leaves up to 16 X 38 cm; near Oransbari, alt. 50 m, ster., *BW 1971* (L); Bari Creek near Oransbari, alt. 80 m, Dec, fr., *Koster BW 11949* (L), leaves 16 X 30 cm, fruit ovoid, 4 x 5 cm; Vogelkop, Oransbari, 50 km E. of Manokwari, secondary forest on stony clay, alt. 10 m. vernacular name "Menako" (Manikiong), Sept., fr., *Versteegh BW 7J,82* (L).

Cryptocarya hartleyi Kosterm., *spec. nov.*

Arbor ramulis glabris laevis atris (in sicco) foliis alternantibus coriaceis glabris ellipticis breve gracile acuminatis basi acutis supra laevia nervo mediano costisque impressis subtus opaca nervo mediano prominentibus costis erectis strictis prominentibus utrinque 5—6 marginem versus arcuatim evanescentibus nervis secundariis parallelis prominulis laxis horizontalis petiolis longis supra canaliculatis, inflorescentiis axillaribus ad innovationem ramulorum brevis sparse pilosis floribus glabris crassis.

TYPUS: *Hartley TGH 13186* (L).

Tree 16 m high, 40 cm in diam.; outer bark grey-brown, scaly, with shallow, horizontal grooves; inner bark reddish brown. Branchlets smooth, rather thick, glabrous, towards apex subangular, black (dried); the branchlets of the flush densely yellowish brown sericeous. Leaves glabrous (in the flush densely sericeous), coriaceous, spirally arranged, elliptical to narrowly elliptical, 2.5 x 10—8 X 16 cm (in the specimen *Schodde 2159* up to 7.5 x 18 cm), apex with a short, slender acumen, base acute; upper surface smooth, midrib and ribs impressed; lower surface dull, midrib prominent, lateral nerves 5—6 pairs, erect, straight, prominent, running out arcuately near the margin; secondary nerves lax, parallel, horizontal, prominulous. Petiole glabrous, 12—20 mm long, channeled above. Inflorescences axillary on thick, densely yellowish sericeous, 1.5—2 cm flush branches; the inflorescence itself almost glabrous or with sparse, adpressed hairs, up to

1.5 cm long, hardly branched; flowers glabrous, thick, dark brownish red (fresh), 3.5 mm long.

TERRITORY OF NEW GUINEA. E. Highlands near Perosa, about 18 miles S. W. of Okapa, alt. 1700 m, Sept., fl., fr., *Hartley 13186* (L); Morobe Distr., Mt. Shungol, 5 miles S. W. of Wagau, Dec, fr., *Hartley 12472* (L), outer bark reddish brown, warty and exfoliating in thin, small, papery plates, inner bark reddish brown, fruit subglobose, 22 x 25 mm, ribbed, hard, green, warty. PAPUA. S. Highland Distr. near Tage, Lake Kutubu, alt. 900 m, ster., *Schodde 2159* (L), tree 25 m, diam. 32 cm, bark redbrown, flaky, vernacular name "Masa" (Kutubu language); this name is used also for *Beilschmiedia podagrica*.

CRYPTOCARYA IDENIBURGENSIS Allen

Cf. Kostermans, Bibl. 407 no. 132. 1964.

New synonym: *Cr. gonioclada* Kan. & Hat.; cf. Kostermans, I.e. 404 no. 112.

The leaves of the flush are golden sericeous on their lower surface, adult leaves tend to be glabrous with a smooth pinkish grey lower surface.

Kanehira and Hatusima's specimen has most leaves obovate-elliptical, but also some with the normal elliptical shape; the typical aureous indumentum can still be seen on some parts.

Additional material: TERRITORY OF NEW GUINEA. E. Highlands Distr., Arau, alt. 1400 m, *Castanopsis* - Oak forest, Oct., fl., Brass 32066 (A, L), tree 15 m, leaves grey below, flowers brownish; Okapa Patrol Rd., *White NGF 9589* (L), Febr., post anthesis, leaves up to 11 X 26 cm; Arau, Oct., fl., Brass 32199 (A, L); Oct. fl., tree 20 m; Aiyura area, Dec, young fr., *NGF 1006* (L), tree 40 m high, 55 cm diam., branches ascending, bole 10 m, buttresses up to 130 cm with one or two shallow channels running up the bole, bark 8 mm, outer brownish; lenticels small and arranged in longitudinal lines, here and there fine, longitudinal cracks present; inner bark green on the back, within pale brown, indistinctly speckled, darkens rapidly on exposure; sapwood corrugated, undefined; wood a pale yellow brown with a few, broad rays; leaves glaucous to whitish beneath, when crushed emitting a strong odour, fruit with similar odour, vernacular name "Monda" (Chimbu); Boridi, alt. 1600 m, *Carr 13032* (A, L), Sept., buds, tree 27 m; Boridi, alt. 1700 m, *Carr 13,245* (A, L), Sept., buds. Cryptocarya longepetiolata Kosterm., *spec. nov.*

Arbor magna ramulis perdense minutissime rubro-fusco sublanuginosis foliis alternantibus chartaceis ellipticis vel subovato-ellipticis acuminatis basi in petiolum contractis acutis supra leavia glabra nervo mediano exceptis nerviis planis subtus dense minutissime atro-rubro sublanuginosa glabrescentia nerviis exceptis sub lente dense areolata costis utrinque 6—8 erecto-patentibus substrictis marginem versus arcuatim evanescentibus prominulis nerviis secundariis parallelis obscuris petiolis

longis infructescentiis axillaris terminalibusque dense atro-rubro minutissime sublanuginosis.

TYPUS: *NGF 1378* (L).

Large tree, up to 47 m high, crown spreadingly branched, foliage pale; bole 32 m, unbuttressed but flared slightly at the base to 120 cm and with a few, shallow channels, diam. 90 cm.; bark 7—12 mm, outer brownish, pustular, lenticels present near the butt, lenticellate lines above, near the top of the bole somewhat fissured; inner bark green in the back, indistinctly speckled, pale brown within; sapwood 7.5 cm, pale straw, poorly defined; heartwood straw. Branchlets very densely, minutely, blackish brown sublanuginose, towards apex subangular. Leaves spirally arranged, chartaceous, elliptical to subovate-elliptical, 3 x 8—5 X 11 cm, acuminate, base contracted into the petiole, shortly acute; upper surface smooth, glabrous, except for the subsistent tomentum on the midrib, main nerves flat; lower surface densely, minutely brown sublanuginose, glabrescent, except on the nerves; midrib prominent; lateral nerves 6—8 pairs, erect-patent, straight, running out arcuately near the margin. Petiole slender, 1—2 cm long, densely minutely pilose, above flattened. Infructescences axillary and terminal, up to 11 cm long, loose, densely, minutely dark brown sublanuginose; flowers 2 mm long, calyx short, petals ovate.

Resembles *Cr. alleniana*, but easily distinguished by the blackish brown tomentum.

PAPUA. Milne Bay, rather swampy, alt. 10 m, *L. S. Smith NGF 1378*, March, fl., fr., (L), distributed as *Cr. alleniana*. TERRITORY OF NEW GUINEA. Bulolo valley, Morobe Distr., alt. 1200 m, June, fr., *Floyd, Havel & Womersley NGF 5293* (L); Bougainville Isl., Tuareruku village, W. of Toiunonapu Plantation, alt. 100m, July, fr., *van Boyen NGF 16445* (K), tree 30 m, fruit subovoid-ellipsoid, ribbed, 1.5 x 2.5 cm.

CRYPTOCARYA LUCIDA BI.

Cf. Kostermans, *Bibl.* 413 no. 168. 1964. — There are two type sheets at Leiden, both sterile, one marked: *Korthals*, G. Sakoembang, Borneo; the other marked Celebes with an interrogation mark. Both sheets belong certainly to the same gathering and the indication Celebes is wrong.

New synonym: *Cryptocarya ramosii* Merr.; cf. Kostermans, *I.e.* 431 no. 261. — Typus: *Ramos B.Sc. 33071* (A, K), Aug., fr., ellipsoid, smooth, 13 X 15 mm, Bangui to Claveria, Ilocos Norte Prov., Luzon; *Ramos B.Sc. 33346* (A, K), Aug., fl., Mt. Palimlin, Ilocos Norte, Luzon.

Additional specimens: *Ramos B.Sc. 394-82* and *39574* (A), April, fl., Puloan, Mindoro; *J. & M.S. Clemens 40218* (A), Aug., fl., Mt. Kinabalu, Penataran Basin, alt. 1500 m.; *Mabesa F.B. 23815* (K), March-April, fr., Mt. Maquiling, Prov. of Laguna, Luzon.

CRYPTOCARYA MAGNIFOLIA Teschn.

Cf. Kostermans, *Bibl. Laur.* 415 no. 176. 1964.

An isotype specimen (*Ledermann 9751*) in the Leiden herbarium shows slight differences with Teschner's description: The branchlets are very thick and have an extremely minute dense sublanuginose rusty tomentum. I would prefer to call the leaves stiffly chartaceous and not coriaceous. The lower surface is glabrous except the very dense very minute rusty tomentum on the main nerves. The panicle is 19 cm long and has a dense sericeous yellowish indumentum.

CRYPTOCARYA MEDICINALIS C. T. White

Cf. Kostermans, *Bibl. Laur.* 416 no. 184. 1964.

The species is only known from the specimen *Walker BSIP 243*. It may be recognized by the peculiar odour, still present in dried material, which is due to the same chemical substance as that of *Cryptocarya massoya* Kosterm. This is apparently the active agent for which the plant is used medicinally.

Cryptocarya microcos Kosterm., *spec. nov.*

Arbor ramulis minutissime dense ferrugineo sublanuginosis foliis alternantibus chartaceis glabrescentibus subovato ellipticis ad lanceolatis longe acute acuminatis basi breve acutis utrinque obscure dense areolato-reticulatis supra nitida nerviis primariis subimpressis subtus glauca nervo mediano costisque utrinque 4 suberectis adscendentibus prominentibus petiolis brevis infructescentiis axillaris dense minutissime ferrugineo sublanuginosis parvis vix ramosis fructus subglobosis costatis glabris.

TYPUS: *Cel/II-342* (L).

Tree, branchlets slender, towards apex densely, minutely dark rusty sublanuginose; leaves spirally arranged, glabrescent, chartaceous, subovate-elliptical to lanceolate, 2 X 7—4 X 13 cm, gradually long-acuminate with sharp tip; both surfaces rather obscurely, densely areolate-reticulate; upper surface with slightly impressed, slender main nerves; lower surface glaucous, midrib prominent, lateral nerves 4 pairs, erect, ascendent, slightly arcuate, the lower pair basal or sub-basal. Petiole 3—6 mm long. Infructescences axillary, densely, minutely, dark rusty sublanuginose, up to 3 cm long, hardly branched, stiff; fruit subglobose, ribbed, smooth, 10 mm diam.

Resembles *Cr. enervis* Hk. f., but has more triplinerved leaves, shorter petioles and a different indumentum.

CELEBES. Distr. Malili, Usu, alt. 25 m, March, fr., *Cel/IV-122* (BO, L); *ibid.*, alt. 100 m, April, fr., *Cel/11342* (BO, L).

CRYPTOCARYA MINDANAENSIS Elmer

Cf. Kostermans, Bibl. 418 no. 195. 1964. — Typus: *Elmer 13269* (L, LE).

Additional material: *Wenzel 2835 et 2859* (A), May fl., Surigao, distributed as *Cr. lauriflora*; *Wenzel 2861*, May, fl. (A), Surigao, leaves 6.5 X 14 cm; *Vidal 1691* (K), fr., San Miquel de Mayumo, Prov. Nueva Ecija, leaves up to 6 X 12 cm, acuminate, 10 pairs of lateral nerves.

CRYPTOCARYA MINUTIFOLIA Allen

Cf. Kostermans, Bibl. 419 no. 198. 1964. — Typus: *Brass 4741* (US).

This is perhaps the highest mountain species of New Guinean Lauraceae.

Additional material: NEW GUINEA. Main Range, N. W. of Crap, alt. 2800 m, Jan., fl., *Carr 15233* (A, L), fls. cream; Centr. Div., Murray Pass, Wharton Range, June-Sept., fr. *Brass 4741* (US) (A, L), Morobe Distr., Mt. Kaindi, alt. 2300 m, common in upper zone of *Nothofagus* forest, densely foliated subcanopy tree, May, ster., *Brass 29711* (A); Goroka subdistr., E. Highlands, Asaro-Mairifutica Divide, alt. 3150 m, tree 20 m, vernacular name "Yip mara" (Hagen: Wankl), Sept., post anthesis, *Pullen 431* (L), the leaves are in this specimen up to 2 X 4 cm.

CRYPTOCARYA MULTINERVIS Teschn.

Cf. Kostermans, Bibl. 420 no 205. 1964. — Typus: *Ledermann 10286* (L), buds, Sepik region.

New synonym: *Cryptocarya sulcata* Allen, p.p., cf. Kostermans, I.e. 435 no. 291, quoad *Clemens 1769* (A, L), Morobe Distr., Wareo, alt. 800 m, Febr., fl., fr.

Additional specimens: PAPUA. *Sehodge 2847* (L), Aug., after anthesis, Sirinumu Area, 7 miles S of Sogeri, alt. 500 m; *NGF 3278* (A, L), N. Div., Ioma, fr. TERRITORY OP NEW GUINEA. Morobe Distr. Sattelberg, Jan., fl., *Clemens 1758* (L); *Hartley TGH 11883* (L), March, fl., Morobe Distr., Tymne-Wago Track, alt. 500 m; *Hartley TGH 11388* (L), *ibid.*, March, fr.

CRYPTOCARYA MULTIPANICULATA Teschn.

Cf. Kostermans, Bibl. Laur. 421 no 206. 1964. — Typus: *Schlechter 17878*.

New synonym: *Cryptocarya cordata* Allen; cf. Kostermans, I.e. 393 no 62; add: Record in Trop. Woods 81: 18. 1945.

Tree 20—40 m, diam. up to 40 cm. Bark reddish brown, smooth or exfoliating in thin, papery plates; inner bark straw, turning reddish brown with red and black hairlike veins. Sapwood yellowish white to pinkish, heartwood (if present) brownish white. Buttresses up to 60 cm, out 40 cm, thick 6 cm (*NGF 8205*, *TGH 10558*, *BW 8483*).

USE: Leaves are heated and applied to sore eyes by natives (*Kajewski 2213*); fruit are used as a relish with certain foods (*Waterhouse 324*).

VERNACULAR NAMES: Watagi (near Babo, W. Irian); Yorcon (Waria dialect, Mori R.); Tukura (New Britain); Nubiri (Teop name, New Britain);

Menako (Manikiong, Vogelkop); Kafu (Berik, W. of Hollandia); Walas (Bilia), Bof (Amele), Lumpai (Dumpu), Mont (Faita), enumerated by *Saunders 555*.

Additional specimens: TERRITORY OF NEW GUINEA. Morobe Distr., Oomsis Creek, alt. 300 m, 18 miles W. of Lae, July, fr., *Hartley TGH 10558* (L); *ibid.*, July, fl., *Hartley TGH 10458* (L); Bulolo, alt. 1200 m, July, (fl., *Havel NGF 9193* (L); *ibid.*, June, young fr., *Floyd NGF 7503* (L); Madang Subdistr., Ramu valley, 5 miles from Taita airstrip, alt. 200 m, ster., *Saunders 555* (L); Trans-Busu Timber Lease near Lae, ster., *NGF 5754* (L), leaves up to 16 X 24 cm, apiculate. Nodup Area, Gazelle Pen., fr., *Waterhouse 324 = Yale Ser. 28621* (A, fragment). SOLOMON ISL. Bougainville Isl., Tembu, Marmaromino, alt. 50 m, common tree, buds, *Kajewski 2213* (A, L). MOLUCCAS. Morotai Isl., Sangowo R., alt. 30 m, young fr., *Kostermans U49* (BO, L).

Cryptocarya nigra Kosterm., spec. nov.

Arbor ramulis gracilibus perdense minute atro rubro sublanuginosis foliis alternantibus pergamentaceo-chartaceis ovato-ellipticis breve conspicue acuminatis basi in petiolum longum gracilium dense pilosum contractis supra glabra nitida obscure perdense subareolata nervo mediano prominulo dense pilosa costis filiformibus obscuris planis subtus dense minute atro-brunneo sublanuginosa nervo mediano prominentibus costis utrinque 5—6 gracilibus prominulis arcuatis erecto-patentibus nerviis secundariis conspicuis prominulis parallelis laxis reticulatio dense vix prominulis paniculis terminalis multifloris laxis gracilis dense ferrugineo sublanuginosis floribus dense minute flavo-brunneo sublanuginosis.

TYPUS: *Muas 13371* (L).

Tree, 27 m high, 40 cm diam.; bark greyish brown, smooth; branchlets slender, very densely, minutely, blackish brown sublanuginose. Leaves spirally arranged, thinly chartaceous, ovate-elliptical, 2.5 X 5.5—4 X 7 cm, distinctly acuminate (acumen ca 5 mm), base contracted into the petiole, often unequal; upper surface glossy, glabrous, obscurely, densely, minutely subareolate, midrib prominulous with subpersistent indumentum, ribs faint, slender, flat; lower surface densely, minutely, blackish brown sublanuginose, glabrescent, midrib prominent, lateral nerves 5—6 pairs, erect-patent, arcuate, slender, prominulous, secondary nerves conspicuously, parallel, lax, prominulous, reticulation dense, actual surface glaucous. Petioles slender, densely pilose, 10—14 mm long. Panicles terminal, slender, lax, many-flowered, few-branched, up to 9 cm; flowers densely, minutely, yellow-brown sublanuginose, up to 3 mm long, subtended by small, sub-subulate bracts.

Cryptocarya nothofagetorum Kosterm., spec. nov.

Arbor mediocris ramulis gracilibus apicem versus dense minute rufo tomentellis ramis glabris griseis graciles foliis alternantibus rigide chartaceis glabrescentibus minute dense conspicue areolatis nerviis primariis supra impressis subtus pallidiora nervo mediano dense ferrugineo tomentellis mox glabris prominentibus costis utrinque 3—5 subrectis arcuatis prominentibus nerviis secundariis perlaxe reticulatis prominulis petiolis gracilis dense tomentellis supra vix aplanatis infructescentiis brevissimis axillaris parte basalibus exceptis subglabris, gracilis fructus (immaturus) ellipsoideus.

TYPUS: *Hartley TGH 12115* (L).

Tree 10 m in *Nothofagus* forest; outer bark grey, smooth, inner bark orange brown; branchlets slender, cylindrical, towards apex densely minutely rusty tomentellous; branches glabrous, slender, smooth, grey. Leaves spirally arranged, rigidly chartaceous, glabrescent, obovate-elliptical, 1.5×3.5 — 4×9 cm, shortly, pointedly acuminate, base acute; both surfaces densely, minutely, prominulously areolate (very conspicuous on lower surface), upper surface with impressed main nerves, lower surface paler, midrib with tardily disappearing tomentellous pilosity, strongly prominent, lateral nerves 3—5 pairs, rather erect, arcuate, prominent, secondary nerves forming a prominulous, very lax reticulation. Petioles cylindrical, 8—10 mm, densely, minutely rusty tomentellous, hardly flattened above. Infructescences axillary, slender, hardly branched, up to 1.5 cm long; the basal part densely tomentellous, the actual inflorescence practically glabrous (a few, very tiny adpressed hairs); fruit few, ellipsoid, 4×7 mm (immature), smooth.

TERRITORY OF NEW GUINEA. Kainantu-Okapa Rd., E. Highlands Distr., alt. 2000 m, in beech forest, July, young fr., *Hartley TGH 12115* (L).

CRYPTOCARYA NOVOGUINEENSIS Teschn.

Cf. Kostermans, Bibl. 422 no 216. 1964.

New synonym: *Cr. archboldiana* Allen; cf. Kostermans, l.c. 386 no. 18. — Type specimen: *Brass & Versteegh 14110* (A).

A specimen *Ledermann 10419* is represented in Leiden. The type specimen *Ledermann 6957* is perhaps not extant any more. Our specimen conforms well with Teschner's description, except for the description of the petioles, which is said to be minutely lanuginose, whereas in our specimen it is minutely sericeous.

Additional material: TERRITORY OF NEW GUINEA. Morobe Distr., Oomsis, alt. 150 m, April, fl., fr., *Brass 29190* (A, L), large tree associated with *Anisoptera* forests of foot hills, leaves greyish below, slightly aromatic, fls. cream; *ibid.*, April-May, fr., *Wright NGF 11131* (A, L); *ibid.* near Butibum R., 7 miles N of Lae, May, young fr., *Hartley TGH 11854* (L), tree 13 m, 30 cm diam., outer bark grey-brown, slightly scaly, inner bark straw, leaves blue green glaucous below, fruit green, hard. Perhaps also (leaves not glaucous and nerves less prominent below): PAPUA. *Schodde 3127* (L), fl. Sept., Subitana Area, Sogeri plateau, Centr. Distr., alt. 700 m, tree 31 m, diam. 40 cm, bark smooth, mid grey outside, midbrown inside, wood mid cream, leaves pale and duller below, fls. light greenish cream; Koitaki, alt. 500 m, July, ster., *Carr 12879* (NY).

CRYPTOCARYA OLIGOCARPA Merr.

Cf. Kostermans, Bibl. 425 no. 229. 1964. — Typus: *Ramos & Pascasio B. Sc. 34716* (A), Surigao Prov., Mindanao, June, fr. (A).

Additional material: PHILIPPINES. *Cenabre, Gellidon & Paras F. B. 27866* (K), Jan.-Febr., fr., Palawan Isl., distributed as *Cr. euphlebica* Merr. (type specimen not seen); Bataan Prov., Luzon, July, fl., *Pascual F. B. 18823* (A); Mt. Maquiling, Laguna Prov., Luzon, Febr., fr., *Canicosa PNH 9616* (L).

Cryptocarya ovato-caudata Kosterm., spec. nov.

Arbor ramulis glabris apicem versus minutissime pulverulente pilosis foliis alternantibus glabris rigide chartaceis ovatis longe acuminatis basi in petiolum gracilem contractis utrinque obscure reticulatis supra nervo mediano basin versus applanato apicem versus subimpresso costis gracillimis subtus nervo mediano prominente costis utrinque 5—6 erecto-patentibus arcuatis prominentibus petiolis supra planis paniculis axillaris terminalibusque multifloris dense minutissime sublanuginosis fructibus magnis.

TYPUS: *BW 3163* (L).

Tree, up to 22 m high, bole 14 m, diam. 50 cm; branchlets glabrous except the minutely, pulverulently pilose apex. Leaves spirally arranged,

stiffly chartaceous, glabrous, ovate, 3 x 8.5—5.5 X 15 cm, apex long and gradually acuminate, base contracted into the 6—10 mm long, above flattened, slender petiole; both surfaces obscurely reticulate, above midrib flattened towards base, subimpressed towards apex, lateral nerves faint; lower surface with prominent midrib, lateral nerves 5—6 pairs (not counted those in the acumen), erect-patent, prominent, slightly arcuate. Panicles axillary and terminal, densely, minutely, grey, sublanuginose (high power lens!), up to 10 cm long, slender; flowers 2 mm long. Fruit smooth, ellipsoid, laterally flattened, up to 2.5 x 4.5 cm.

W. IRIAN. Bomberai Peninsula, Budidi R., Distr. Fak-Fak, low, periodically inundated, fls. yellowish green, fruit smells of cajuput oil, *BW 313U* (L); *ibid.*, June, 11., *BW 3163* (L); Sauwah, Asmat region, S. Division, periodically inundated, ster., *BW 6603* (L).

***Cryptocarya pachyphylla* Kosterm., spec. nov.**

Arbor ramulis crassis glabris foliis alternantibus rigide coriaceis glabris ovatis obscure breve acuminatis basi breve acutis supra laevia nitida nervo mediano costisque impressis subtus dense minute reticulata nervo mediano prominentibus eostis utrinque 3—5 prominentibus suberectis arcuatis petiolis crassis latis paniculis fructiferis terminalis virgatis striatis latis glabris apicem versus minutissime pilosis fructus immaturus.

TYPUS: *Bmss & Versteegh 11985* (A).

Tree 23 m high; branchlets thick, smooth, glabrous. Leaves spirally arranged, very stiffly coriaceous, glabrous, ovate, up to 6.5 x 9 cm, obscurely, shortly acuminate, base shortly acute; upper surface glossy, smooth, main nerves impressed; lower surface minutely reticulate, midrib prominent, lateral nerves 3—5 pairs, prominent, rather erect (the lower ones often ascending), arcuate, secondary nerves parallel, prominulous. Petioles thick, up to 1 cm long, flattened and broadened towards apex above. Infructescence terminal, up to 15 cm long, paniculate, coarse, stiff, glabrous, except the minutely pilose- apices. Fruit immature.

WEST IRIAN. Idenburg R., 15 km SW of Bernhard Camp, alt. 1750 m, frequent, Jan., fr., *Brass & Versteegh 11985* (A, L).

***Cryptocarya parallelinervia* Kosterm., spec. nov.**

Arbor ramulis perdense minutissime adpresse pilosis pilis strigosis foliis alternantibus rigide chartaceis subovato-ellipticis apice late acuminatis basi acuminatis supra glabra laevia nerviis principalis impressis subtus griseis (in sicco) junioribus dense minutissime sericeis adultis glabris axillis costarum barbellatis exceptis nervo mediano costisque utrinque 4—5 suberectis paulo arcuatis prominentibus nerviis secundariis conspicuis parallelis horizontalis prominulis paniculis brevis axillaris terminalibusque dense minutissime adpress ferrugineo pilosis floribus pilosis.

TYPUS: *Carr 12878* (A).

Tree, branches smooth, brown or black (dried), rather slender; branches densely, minutely adpressed pilose, hairs rather coarse. Leaves spirally arranged, stiffly chartaceous, subovate-elliptical, 3.5 x 10—6 x 13 cm; apex shortly, broadly acuminate, base acuminate; upper surface smooth, main nerves impressed; lower surface in young (flush) leaves with a dense tomentum of tiny, adpressed, rather coarse, silky hairs, adult leaves glabrous, except the barbellate axils of the lateral nerves, grey (in sicco), midrib prominent, lateral nerves 4—5 pairs, rather erect, rather straight, prominent, near the margin arcuate; secondary nerves conspicuous, parallel, horizontal, prominulous. Petioles 10—15 mm long, rather slender, flat above. Panicles axillary and terminal, 2.5—6 cm long, densely, minutely, adpressed, ferrugineously pilose, many-flowered. Flowers 2—3 mm, adpressed pilose, calyx short; tepals ovate.

TERRITORY OF NEW GUINEA. Koitaki, alt. 500 m, July, buds, *Carr 12878* (A, L); Boridi, alt. 1300 m, fl., *Carr 1U335* (A, BM); *ibid.*, Oct., buds, *Carr 1315%* (BM, L); Morobe Distr., Sattelberg, Hill forest, alt. 1100 m, Febr., buds, *Clemens 1824*. (A), tree, diam. 10—15 cm, leaves pale beneath; *ibid.*, Febr., buds, *Clemens 1887* (A); perhaps also: *BW 2272*, Sarmi, ster., alt. 8 m (L).

***Cryptocarya patentinervis* F. v. M. ex DC. var. *glabra* Kosterm., var. nov.**

Ab species typicum differt foliis ramulisque glabris

TYPUS: *Hartley TGH 12165* (L).

As no fruit are available for further comparison I have referred the following specimens to *Cr. patentinervis* as a variety, pending a definite decision.

TERRITORY OF NEW GUINEA. Base of Kratka Range, 12 miles S. of Aiyura, E. Highlands, Aug., fl., *Hartley TGH 12165* (L), tree 10 m, diam. 15 cm in beech forest at 2000 m alt.; Kainantu-Okapa Rd., *Hartley TGH 12151* (L), tree 10 m in beech forest, alt. 2000 m, outer bark grey-brown, quite smooth, inner bark reddish brown, pale glaucous below. W. IRIAN. Kebar Valley, alt. 770 m, stony and clayey soil, ster., *BW 7095* (L), rather common, tree 15 m, diam. 40 cm, buttresses up to 1 m, out 15 m, thick 4 cm, outer bark grey, smooth, inner bark yellow-brown, slash brown, sapwood lightbrown, no heartwood, leaves up to 5 X 14 cm.

***Cryptocarya percrassa* Kosterm., spec. nov.**

Arbor ramulis cylindricis indumentum dense rufum minutissime pulverulentum perobscurum obtectis foliis alternantibus rigide coriaceis glabris supra laevia nitida nervo mediano costisque impressis subtus pallida laeve vel obscure dense areolata nervo mediano prominente costis utrinque 5—8 erecto-patentibus substrictis marginem versus arcuatim evanescentibus prominulis petiolis distinctis; paniculis axillaris terminalisque perdense minutissime flavo lanuginosis; floribus dense pilosis.

TYPUS: *NGF 4051* (A).

Tree 20 m high, 30 cm diam., outer bark dark brown, flaky; living bark orange brown; sapwood and heartwood straw coloured; branches cylindrical, smooth, towards apex with a hardly visible, very dense, pulverulent, grey or rusty tomentum. Leaves spirally arranged, glabrous, rigidly coriaceous, subovate-elliptical, 4x 9—6 x 13 cm; apex obscurely acuminate, base cuneate; upper surface glossy, smooth, midrib and lateral nerves impressed; lower surface paler, smooth, midrib prominent, lateral nerves 5—8 pairs, erect-patent, rather straight, near the margin running out arcuately. Inflorescences axillary and terminal, densely, minutely, yellowish sublanuginose, 3—9 (axillary) to 11 cm (terminal), many-flowered; flowers densely, minutely sublanuginose, 3 mm long.

TERRITORY OF NEW GUINEA. Morobe Distr., Bulolo, alt. 1200 m, on the flat land, planting area, Jan., fl., *Fryaf 4051* (A); *ibid.*, June, young fr., *Richardson 4086* (L), tree 27 m, diam. 45 cm, large, spreading crown, slight buttresses up to 120 cm, bark 12 mm, brown with slightly reddish tinge outer, blaze brown, light brown against the wood, wood straw coloured, a few walnut streaks, no heartwood, hacks off easily but would not quarter with axe; *ibid.*, July, fl., *Floyd 5239* (L), tree 20 m, diam. 30 cm, leaves shining green above, dull glaucous with yellow veins beneath, fls. yellow brown; *ibid.*, Oct., fr., *McViegh & Ridgwell NGF 7340* (A, L).

CRYPTOCARYA PERGAMENTACEA Allen

Cf. Kostermans, Bibl. 428 no 249. 1964.

Additional material: W. IRIAN. Genofa Mt., Distr. Fak-Fak, stony, clay soil, alt. 800 m, ster., *BW 10Z8.4* (L), scarce, tree 30 m, diam. 40 cm, bark strongly peeling, not fissured, greyish brown outside, brownish, yellow within, slash brownish yellow; used as medicine against many diseases.

Cryptocarya pergracilis Kosterm., *spec. nov.*

Arbor mediocris ramulis gracilibus glabris laevis foliis alternantibus subcoriaceis glabris lanceolatis caudato-acuminatis basi cuneatis utrinque obscure dense reticulatis supra nervo mediano costisque planis subtus nervo mediano prominentibus costis utrinque 7—9 pergracilis obscuris prominulis erecto-patentibus petiolis gracilibus glabris. Inflorescentiis axillaribusque subglabris, gracilibus parvis subpaucifloris floribus calyx dense minutissime adpresso pilosis tepalibus ovatis parce pilosis.

TYPUS: *Carr 1VT71* (L).

Tree, 10 m tall; branchlets glabrous, slender, smooth, black (dried). Leaves spirally arranged, subcoriaceous, glabrous, lanceolate, 1.5 x 5—3 x 9 cm, apex caudate, acumen slender, blunt, base cuneate; both surfaces densely, rather obscurely (more conspicuous on the lower surface), densely reticulate; midrib and ribs flat on the upper surface (except the basal part of the midrib, which might be subimpressed); lower surface with prominulous midrib and rather obscure, slender, erect-patent, 7—9 pairs of erect-patent lateral nerves. Petioles glabrous, slender, 5—10 mm, slightly concave above. Panicles axillary and terminal, lax, rather few-flowered,

up to 5 cm long, basal part glabrous, slender, branches few, up to 1 cm long, slender, towards apex sparsely, minutely, adpressed pilose; flowers 2.5 mm long on a very short pedicel; calyx densely, minutely, adpressed pilose; tepals ovate, partly pilose.

TERRITORY OF NEW GUINEA. Boridi, alt. 1800 m, Oct., fl., *Carr U606* (A, BM, L), flowers cream; *ibid.*, 1500 m, Nov., fl., *Carr 14771* (L), flowers white; *ibid.*, Sept., buds, *Carr 13373* (NY). W. IRIAN. Vogelkop Pen., path to Arfak Mts, alt. 1000 m, ster., *Kostermans 2015* (BO, L).

CRYPTOCARYA PERLUCIDA Allen

Cf. Kostermans, Bibl. 428 no 250. 1964. — Typus: *Clemens 4076* (A), Morobe Distr., Yunzaing, alt. 1600 m, Sept., fl.

Additional specimen: K. Wilhelmsland, 1200 m, Disolore (?), ster., *Sohlechter 19614* (K).

Cryptocarya pulchrinervia Kosterm., *spec. nov.*

Arbor ramulis percrassis angulatis minutissime dense ferrugineo pilosis, foliis alternantibus rigide coriaceis elongato ovato-oblongis vel oblongis, supra glabra nerviis impressis subtus perdense conspicue prominente reticulatis rufo-fusco pilosis, petiolis crassis brevis; infructescentiis crassis fructus elongato-ovatis costatis magnis.

TYPUS: *Kostermans 1334.7* (L).

Tree, 15—30 m high, bole up to 17 m high, 45 cm in diam. Bark light redbrown, thin (0.5 mm), smooth or scaly; living bark 10 mm, pale yellow to light reddish brown; cambium yellow. Wood white, hard. Branches stout, angular or subangular, densely, minutely rusty pilose. Leaves spirally arranged, stiffly coriaceous, elongate ovate-oblong, 5 x 21 (6 X 30) to 13 X 22 cm (in the inflorescence 3 x 9 cm), apex obscurely acuminate or obtuse to emarginate, base rounded, upper surface glabrous, glossy, midrib, lateral, secondary and tertiary nerves impressed; lower surface densely, conspicuously prominently reticulate, dark rusty pilose, midrib stout, prominent, lateral nerves 11—17 pairs, rather patent, arcuate near the margin, strongly prominent. Petiole stout, 1 cm long, densely, minutely pilose. Panicles lax, wide, minutely, densely, pilose, up to 22 cm long with stout, sulcate axis. Flowers sessile, densely, minutely grey adpressed pilose. Infructescences axillary and terminal, up to 22 cm long, stout, few-branched, glabrescent. Fruit elongate ovoid, up to 4 cm long and 2.5 cm in diam. with broad protruding ribs; apex narrowed.

DISTRIBUTION: Borneo

The species is somewhat related to *Cr. crassinervia*, but is easily distinguishable by the enormous fruit, the dense reticulation and the elongate leaves.

Cryptocarya pullenii Kosterm., spec. nov.

Arbor mediocris ramulis junioribus dense minutissime pulverulente brunneo pilosis dense prominule lenticellatis ramis verrucosis foliis alternantibus rigide coriaceis glabris ellipticis emarginatis vel obtusis vel brevissime inconspicue acuminatis basi rotundatis supra nitida bullata nerviis primariis impressis subtus nervo mediano valde prominentibus costis utrinque 7—8 erecto patentibus marginem versus arcuatis prominentibus nerviis secundariis parallelis laxis prominulis petiolis brevis paniculis axillaris terminalibusque foliorum subbreviorum perdense minutissime sericeis floribus pro genera grandis.

TYPUS: *Pullen 6591* (K).

Tree, 13 m high; bark brown with many lenticels, blaze yellow brown with lauraceous smell (*Pullen*); young branchlets very densely, minutely, pulverulently brown pilose with numerous, prominent, elongate lenticels. Leaves spirally arranged, glabrous, rigidly coriaceous, elliptical, 2.5 X 5 (near the inflorescence)—6 x 11 cm, obtuse, emarginate or obscurely, shortly acuminate, base rounded; upper surface smooth, bullate, glossy, midrib, ribs and secondary nerves impressed; lower surface more dull, midrib strongly prominent, lateral nerves 7—8 pairs, erect-patent, prominent, arcuate towards the margin; secondary nerves prominent, parallel, lax. Young leaves very minutely, laxly pulverulently pilose on the lower surface (denser on midrib). Petiole 5—10 mm long, rather thick, partly narrowly channeled above. Panicles axillary and terminal, densely, minutely

sericeous, stiff, up to 9 cm long, with few, short branches; flowers many, 3 mm long, sericeous, calyx short.

PAPUA. Gulf Distr., Head of Lohiki R., N. of Ivana, alt. 1700 m, local name "Ko-ohèh" (Nauti language), March, fl., *Pullen 6591* (A, K, L, LAE).

Cryptocarya renicarpa Kosterm., spec. nov.

Arbor ramulis gracilibus laxè minutissime pulverulente pilosis, foliis alternantibus ovato-lanceolatis glabris rigide chartaceis longe caudato acuminatis basi acutis utrinque opacis subtus (in sicco) pallidioribus supra laevia subtus nervo mediano costisque utrinque 3—5 adscendentibus prominentibus nerviis secundariis gracilis horizontalis prominulis, petiolis brevis; infructescentiis axillaris terminalisque dense minutissime pulverulente brunneo pilosis vix ramosis, fructus glaber reniformibus.

TYPUS: *Beer's Coll. BSIP 7684* (L).

Tree; branchlets slender with a rather lax pulverulent, minute indumentum. Leaves spirally arranged, glabrous, rigidly chartaceous, subovate-lanceolate or ovate-lanceolate, 2 x 8—4 X 12 cm; apex caudate-acuminate (acumen up to 2 cm long with narrow, blunt tip), base acute; both surfaces dull, lower one pale (in sicco), above smooth, lower one with prominent midrib and 3—5 ascendent pairs of lateral nerves, secondary nerves spaced, slender, horizontal, prominulous. Petiole 6—8 mm long, glabrous, flat above. Infructescences axillary and terminal, hardly branched, densely brown pulverulently pilose, up to 7 cm (terminal) or 4 cm (axillary) long; fruit glabrous, glossy, smooth, transversally reniformous, up to 3 cm wide and 2 cm high.

DISTRIBUTION: Solomon Isl.

The reniform fruit, broader than high, is not common in *Cryptocarya*. So far it is only known in some Australian species.

SOLOMON ISL. N. Santa Ysabel, Potoro Bay, Aug., fr., *Beer's Coll. BSIP 768k* (L); *ibid.*, Moloforu Bay, *Beer's Coll. 7387*, July, fr. (L); Malaita near Heho R., tree 33 m, spur roots running into rounded flanges high on the trunk, bark brown, roughened by numerous longitudinally arranged lenticels, ster., *Walker & White BSIP 81* (L).

Cryptocarya resinosa Kosterm., spec. nov.

Arbor ramulis gracilibus minutissime dense ferrugineo adpresso pilosis ramis glabris laevis cylindricis subgracilis foliis alternantibus chartaceis subovato-ellipticis conspicue acuminatis basi in petiolum gracilem contractis supra glabra sublaevia nervo mediano costisque filiformibus prominulis subtus juniora minutissime adpresso pilosa adulta glabra, dense reticulata (sub lente) nervo mediano prominentibus costis utrinque 3—4 (—5) suberectis subarcuatis prominulis saepe costis subbasalibus adscen-

dentibus infructescentiis axillaris minutissime dense adpresse pilosis late paniculatis foliis longioribus fructus ellipsoideus resinoso-punctatus.

TYPUS: *Versteegh BW 4-666* (L).

Tree up to 28 m high, 40 cm in diam.; branchlets slender, densely, minutely, adpressed, ferruginously pilose; branches slender, glabrous, smooth. Leaves spirally arranged, subovate-elliptical, 3.5 x 8—6 X 14 cm, apex distinctly acuminate, base contracted into the petiole, shortly acute; upper surface rather smooth, the filiform midrib and lateral nerves prominulous; lower surface densely reticulate (high power lens), in young leaves sparsely, minutely, adpressed pilose, glabrescent, midrib prominent, lateral nerves 3—4(—45) pairs, prominulous, rather erect, slightly arcuate, sometimes ascendent subbasal ribs. Petiole slender, 5—10 mm, flattened above. Panicles axillary, minutely, densely, adpressed pilose, up to 14 cm long, loose, few-branched, lower branches up to 5 cm long, the ultimate branchlets (up to 3 mm) bearing the ripe fruit, thickened (3 mm diam.); fruit ellipsoid, up to 18 x 25 mm, at base with a short (4 mm) neck; covered with, white resinous (?) spots.

The species is outstanding by a white exudate which not only shows on the fruit as white spots but also on the leaves, where these are broken.

W. IRIAN. Salawati Isl., Kaloal, alt. 0 m, inundated in the wet season, rather common, ripe fruit black, *Versteegh BW U666* (A, BO, CANB, L, LAE, MELB, P, SING); Manokwari, Vogelkop, Prafi, alt. 150 m, Febr., young fr., *Bouwer BW 357* (L); Distr. Hollandia, Sekoli plane, alt. 75 m, ster., *BW 7530* (L), bark smooth, dark brown, brownish yellow inside, slash brown, sapwood brownish yellow; Distr. Kaimana, Fak. Fak, Nov., buds, *BW 51A6* (L).

CRYPTOCARYA RETICULATA Bl.

Cf. Kostermans, *Bibl.* 431 no 263a. 1964. — Typus: *Korthals* s.n., G. Sakumbang-, Borneo, ster. (L) and sine collector, Java, ster., "Huru medang lalakina" Sund. (which simply means: male Lauraceae!) (L).

These specimens represent *Phoebe grandis* (Nees) Merr.

Cryptocarya rhizophoretum Kosterm., *spec. nov.*

Arbor humilis glabris parte perjuvenilis pulverulente minutissime dense pilosis exceptis foliis alternantibus subcoriaceis elongato ovato-ellipticis longe acutis vel subacuminatis basi brevissime cuneatis utrinque prominule laxe obscure reticulatis nervo mediano supra impressa subtus prominente costis utrinque 7—8 erecto-patentibus subcurvatis marginem verse saepe adscendentibus evanescentibus nerviis secundariis parallelis laxis prominulis petiolis longis supra subcanaliculatis; infructescentiis axillaribus terminalibusque non ramosis fructus ellipsoideus magnis laevis nitidus.

TYPUS: *Gray & Floyd 8042* (L).

Tree 7 m high, 12.5 cm in diam., glabrous, except the youngest flush, which is densely, minutely pale-brown pulverulently pilose. Branchlets rather slender, smooth, black (in sicco). Leaves spirally arranged, subcoriaceous, elongate ovate-elliptical, 4 X 12—6.5 X 18 cm, apex gradually long-acute or subacuminate with slender tip, base shortly cuneate; both surfaces rather inconspicuously, laxly reticulate; midrib impressed on upper, prominent on lower surface, lateral nerves 7—8 pairs, erect-patent, slightly curved, running out near the margin; secondary nerves lax, parallel, prominulous. Petioles 15—20 mm long, slightly, narrowly channeled above. Infructescences axillary and terminal, up to 5 cm long, hardly branched; fruit ellipsoid, glossy, black-purplish, 27 x 55 mm, hardly narrowed at base, top obtuse.

PAPUA. Gulf Div., Kikori subdistr., Aird Hills, transition zone of *Myristica-Excoecaria-Brugniera gymnorhiza* transition forest, July, fr., *Gray & Floyd 804-2* (A, K, L).

CRYPTOCARYA RUGULOSA Hk. f.

Cf. Kostermans, *Bibl.* 433 no 273. 1964. — Typus: *Maingdy K.D. 1262* (K, L), Malacca, June, fl (= *Maingay 2b66*).

New synonym: *Cryptocarya longepaniculata* Gamble; cf. Kostermans, *I.e.* 412 no 163. — Typus: *Haviland and Hose 3295* (K, L). — *Cryptocarya longepedunculata* Merr. (sphalm.), cf. Kostermans, *I.e.* 413 no 164.

Cryptocarya ruruvaiensis Kosterm., *spec. nov.*

Arbuscula ramulis dense minutissime ferrugineo tomentellis, foliis alternantibus coriaceis oblongis apice breviter acuminatis basi rotundatis utrinque glabris dense prominule areolatis nervo mediano supra impressa subtus prominentibus costis filiformibus prominulis patentibus marginem versus arcuatim evanescentibus petiolis brevis; paniculis brevis axillaribus minutissime rufo pilosis glabrescentibus floribus calyx gracilis sepalibus glabris longioribus.

TYPUS: *Whitmore BSIP 298A* (L).

Shrub, 3 m tall; branchlets densely, minutely rusty tomentellous. Leaves spirally arranged, coriaceous, glabrous, oblong, 2 x 7.5—3 x 9 cm, apex shortly acuminate, base rounded; both surfaces densely prominently areolate, midrib slightly impressed on upper, prominent on the lower surface; lateral nerves 7—8 pairs, slender, prominulous on both sides, straight, rather patent towards the margin, running out arcuately. Petioles glabrescent, 5—6 mm long. Panicles narrow, axillary, up to 3.5 cm, hardly

branched, minutely rusty pilose, glabrescent. Flowers sessile, glabrous; tube slender, 1 mm; tepals 1.5—2 mm.

An outstanding species by leafshape and reticulation. The inflorescences are attacked by a fungus and I suspect that in normal condition they are more pilose.

SOLOMON ISL. S. E. Choiseul, ultrabasic outcrop across bay from Ruruvai, sea level, inside edge of mangrove, fls. pale green, not scented, Febr., *Whitmore BSIP 2984* (L).

Cryptocarya subbullata Kosterm., *spec. nov.*

Arbor parva ramulis gracilibus dense minute rufo tomentellis innovationibus dense minuteque rufo strigosis foliis alternantibus papyraceis obovato-ellipticis perconspicue acuminatis basi rotundatis supra glabra nitida sub-bullata nervo mediano costisque profunde impressis subtus dense minuteque reticulatis nervo mediano prominentibus pilosis costis utrinque ca 9 suberectis prominentibus substrictis marginem versus arcuatis petiolis brevis dense tomentosis paniculis axillaribus parvis brevissime pauce ramosis dense minuteque ferrugineo tomentellis floribus parvis dense pilosis.

TYPUS: *Hoogland 4-545* (L).

Small tree, ca 7 m high, 3 m bole, 10 cm diam.; bark ca 4—5 mm thick, grey-brown with faint, short, longitudinal fissures, inner bark red-brown; wood straw; branchlets slender, densely, minutely rusty tomentellous; end bud densely, minutely rusty strigose. Leaves spirally arranged, papery, obovate-elliptical, 4 X 12—6 X 15 cm, conspicuously, abruptly acuminate (acumen ca 1 cm), base rounded with incurved margins; upper surface smooth, glossy, glabrous, main nerves deeply impressed; lower surface densely, minutely reticulate, glabrous (except the main nerves), midrib prominent; lateral nerves ca 9 pairs, erect-patent to suberect, rather straight, near the margin arcuate, prominent. Petioles 5—8 mm, densely, rusty tomentellous. Panicles axillary, narrow, densely, minutely, rusty tomentellous, 0.5—3 cm long with few, short (up to 5 mm) branches and persistent narrow, tomentellous bracts and bracteoles. Flowers densely adpressed pilose, 2.5 mm long; calyx short.

Cryptocarya sulavesiana Kosterm., *spec. nov.*

Arbor ramulis minutissime dense sericeis foliis alternantibus subovato-lanceolatis coriaceis acuminatis supra glabra opaca nervo mediano gracilis prominulo costis subimpressis subtus dense minutissime sericeis nervo mediano costisque utrinque 6—8 subarcuato erecto-patentibus prominulis, apex subacuminatis, basi in petiolum contractis; paniculis axillaris terminalisque dense minute sericeis brevis multifloris floribus sessilibus sericeis.

TYPUS: *Cel/III-46* (L).

Tree; branchlets minutely densely adpressed pilose. Leaves spirally arranged, subcoriaceous, subovate-lanceolate, 2.5—8 X 4.5—16 cm, apex obscurely acuminate with sharp tip, base subrounded; upper surface smooth, dull, midrib prominent, slender, lateral nerves faint, slightly impressed; lower surface densely, minutely sericeous, midrib prominent, lateral nerves 6—8 pairs, suberect-patent, slightly arcuate, running out towards the margin. Petioles 8—10 mm, flattened above. Panicles axillary and terminal, densely, minutely sericeous, up to 6 cm long, many flowered; flowers sessile, 2 mm, sericeous.

DISTRIBUTION: Central Celebes.

Related to *Cr. aureo-sericea* Kosterm., but differs by the stiffer, narrower leaves, the shorter inflorescences and the larger flowers.

Cryptocarya sumatrana Kosterm., *spec. nov.*

Arbor ramulis glabris apicem versus minutissime dense rufo pulverulente sublanuginosis ramis lenticellatis foliis alternantibus chartaceis glabris ellipticis vel subobovato ellipticis utrinque obscure minutissime areolatis apice breve acuminatis basi acutis supra nitida nervo mediano subimpresso costis filiformibus planis subtus opacis nervo mediano prominibus costis utrinque 8—10 erecto-patentibus strictis graciles prominulis nerviis secundariis laxis parallelis prominulis petiolis cylindricis conspicuis infructescentiis axillaris terminalibusque glabris laxis paucis ramosis fructus cylindricus (immaturus) costatis.

TYPUS: *bb* 8798 (L).

Tree, branches lenticellate; branchlets smooth, glabrous, the apical part with a dense, very minute, pulverulent, sublanuginose tomentum. Leaves spirally arranged, chartaceous, elliptical to subovate-elliptical, 4 X 10—6.5 X 14 cm, shortly pointedly acuminate, base acute, both surfaces densely, minutely, obscurely areolate; upper surface glossy with impressed midrib, lateral nerves very slender, rather obscure; lower surface dull, midrib prominent, lateral nerves 8—10 pairs, erect-patent, straight (arcuate near the margin), slender, prominent, secondary nerves faint, parallel, prominulous. Petioles glabrous (in leaves of the flush pulverulently sublanuginose), cylindrical, 7—13 mm long. Infructescences axillary and terminal, glabrous, lax, with few, rather erect, straight branching, up to 10 cm long; immature fruit ellipsoid, ribbed, 5 x 9 mm.

DISTRIBUTION: South & Central Sumatra and Java.

CRYPTOCARYA VERRUCOSA Teschn.

Cf. Kostermans, Bibl. 439 no 314. 1964.

The type specimens *Ledermann 10097* and *8714* were not available for examination and might not be extant any more. The specimens, enumerated here, agree with the description, except for some minor points; the leaves should be minutely lanuginose, in our specimens the adult leaves are glabrous, the young ones densely, minutely sericeous. The conspicuous character, stressed by Teschner, the pale warts (lenticels) on the branchlets and basal part of inflorescence, are conspicuous.

ENDIANDRA R. Br.

Endiandra minutiflora Kosterm., *spec. nov.*

Arbor mediocris in omnibus partibus glabris innovatione inflorescentiisque exceptis ramulis gracilibus strictis laevis foliis alternantibus chartaceis ellipticis brevissime late acuminatis basi cuneatis supra obscure laxe reticulata vel sublaevia nervo mediano costisque impressis subtus prominule laxe reticulata nervo mediano prominentibus costis utrinque 6—7 erecto-patentibus paullo arcuatis prominulis petiolis longis supra canaliculatis paniculis axillaris persparse minutissime pulverulente pilosis mox glabris foliis brevioribus pedunculis sublongis subgracilis ramis paucis brevibus floribus minutis tepalibus ovatis acutis staminibus 3 antheris extrorsis depresso-ovatis glandulis basalibus adest ovario non vidi.

TYPUS: *Floyd, Gray & Middleton NGF 8073 (A).*

Tree, 10—12 m high, 15 cm diam., glabrous in all its parts except the minutely sericeous endbud and the inflorescences; branchlets smooth, rather slender, straight, cylindrical, at apex obscurely, laxly, minutely pilose. Leaves spirally arranged, chartaceous, elliptical, 5 X 12.5—8.5 x 18 cm, broadly, shortly acuminate, base cuneate; upper surface obscurely, laxly reticulate, main nerves impressed; lower surface laxly, prominently reticulate, midrib prominent, lateral nerves 6—7 pairs, prominent, erect-patent, slightly arcuate. Petioles 2—3 cm long, narrowly channeled above. Panicles axillary, obscurely, very laxly, pulverulently pilose, glabrescent, up to 10 cm long, peduncle 2—5 cm, rather slender, branchlets few, stiff, up to 2 cm long (basal ones), bracts minute, subsistent under the flowers; flowers 3 mm diam., glabrous, pedicel 1.5 mm, sparsely pilose; tepals ovate, acutish, 1.5 mm long; stamens 3, anthers depressed ovate, acute, cells 2, large, extrorse; basal glands globose. Ovary not seen.

Only a single mature flower was available for dissection and this was partly malformed.

PAPUA. Gulf Distr., A. P. C. logging area, Seribi R. near Middletown, July, 1961, *Floyd, Gray & Middleton NGF 8065, 8073 (A).*

ENDIANDRA SPHAERICA Allen

Endiandra sphaerica Allen in J. Arn. Arb. 23: 150. 1942; Kostermans, New and Crit. Mai. Pl. 4: 31. 1955; in Reinwardtia 4: 31. 1956; Bibl. Laur. 495 no 80. 1964.

The type specimen *Brass 7512 (A, BM, K, L)* represents *Beilschmiedia novoguineensis* Teschner, whereas the loose fruit, after which the specific epithet was created, belong to a species of *Prunus (Pygeum)*. The fruit have indeed a persistent calyx, but the sepals are different in number from those of Lauraceae.

Endiandra whitmorei Kosterm., *spec. nov.*

Arbor mediocris ramulis subangulatis glabris laevis foliis alternantibus chartaceis vel rigide chartaceis glabris subobovato-ellipticis brevissime obscure acuminatis vel obtusis basi cuneatis utrinque laxe prominule reticulatis supra nervo mediano piano costis filiformibus subtus glaucus nervo mediano prominentibus costis utrinque 5—6(—8) erecto-patentibus gracilis strictis marginem versus arcuatim evanescentibus petiolis longis paniculis axillaris glabris vix ramosis gracilis floribus longe pedicellatis staminibus 3, introrsis.

TYPUS: *Whitmore BSIP 1756 (K).*

Tree, reaching 17 m with deep, dense, dark green crown; equal plank buttresses up to 160 cm; bark smooth, rugose, with a fine pattern of vertical cracks, grey, small, fawn lenticels; slash: wood cream, tinged pink inwards, bark orange brown, firm, fibrous with cream radial fingers. Branchlets glabrous, angular; end bud minutely sericeous. Leaves spirally arranged, chartaceous to stiffly chartaceous, subobovate elliptical, 4 X 9—7 X 13 cm, obtuse or obscurely, shortly acuminate, base cuneate, both surfaces laxly, prominently reticulate, upper surface with flat midrib and filiformous ribs, lower surface glaucous, midrib prominent, lateral nerves 5—6 pairs, erect-patent, straight, towards margin running out arcuately. Petioles 15—20 mm long, hardly flattened above. Panicles axillary, almost glabrous, narrow, lax, up to 7 cm long, consisting of a slender peduncle and few, slender, up to 1.5 cm long branchlets, flowers glabrous, 2—3 mm; tepals ovate, acute; stamens 3, elongate-ovate, 2-celled, extrorse, basal glands conspicuous; filaments very short, pilose; staminodes conspicuous; ovary glabrous with a short style and inconspicuous stigma. Fruit obtuse, ellipsoid, 2.5 x 4.5 cm, cotyledons pink.

Resembles *E. gillespiei* A. C. Smith.

SOLOMON ISL. Santa Cruz group, Vanikoro, middle ridge, 500 m, April, fl., young fr., *Whitmore BSIP 1756 (K)*; *ibid.*, Lawrence valley, May, buds, *Whitmore BSIP 1807 (K)*; W. Choiseul, Roke R., March, fl., *Whitmore's Coll. BSIP 5U07 (L)*, flowers yellow, not scented; slopes of Mt. Komboro, alt. 150 m, March, fr., *Whitmore BSIP U0U1 (K, L)*, fruit smooth, ellipsoid, 1.5 X 3 cm.

LINDEEA Thunb.

Lindera kinabaluensis Kosterm., *spec. nov.*

Arbor? in omnibus partibus glabris innovatione exceptis ramis griseis suberosus ramulis laevibus subgracilis atris (in sicco) foliis alternantibus coriaceis rigidis oblongis brevissime acutis vel subacuminatis basi in petiolum contractis brevissime cuneatis utrinque laxe prominule reticulata vel supra laevia nervo mediano supra plana vel obscure impresso costis obscuris saepe subimpressis subtus nervo mediano prominulo costis pergracilis subpatentibus subarcuatis prominulis petiolis brevis umbellulae pedunculis

gracilis longis ramulis brevissimis axillaribus impositus plerumque singularis.

TYPUS: *SFN 26578* (K).

Tree (?) glabrous in all its parts, the minutely adpressed rusty pilose endbuds excepted; branches grey, corky; branchlets smooth, glossy, reddish brown. Leaves spirally arranged, stiffly coriaceous, oblong, 3 x 4—4 X 11 cm to broadly elliptical, 5.5 X 9.5 cm, very shortly acute or obscurely acuminate, base contracted into the petiole, shortly cuneate, both surfaces laxly, prominulously reticulate or smooth above; upper surface with flat or scarcely impressed midrib and very slender, obscure, often slightly impressed lateral nerves; lower surface with prominulous midrib; lateral nerves slender, prominulous, rather patent, somewhat arcuate, 6—9 pairs. Petiole 5—7 mm long, flattish above. Umbels (4 mm in diam. just before anthesis) on slender, 1—2 cm long peduncles, which are (usually only one) placed on axillary shortened branchlets of 5 mm long.

SABAH. Mt. Kinabalu, Marai Parai, 1700 m, March, buds, *Clemens 82362* (BM, K); *ibid.*, alt. 1400 m, March, buds, *SFN 26578* (K, SING); Ranau, above Kamarango, alt. 2500 m, Febr., buds, *Meyer SAN 29258* (K, L), open, grassy places with *Leptospermum* and *Calamus*; Colombon R., 3000 m, July, buds, *J. & M.S. Lindera novoguineensis Kosterm., *spec. nov.*

Arbor humilis ramulis gracilibus junioribus cum foliis perdense rufo tomentosus foliis alternantibus pergamentaceis subovato-ellipticis caudato-acuminatis basi breve acutis utrinque (sub lente) dense areolatis, supra glabra, nerviis primariis impressis exceptis subtus glauca (in vivo) nervo mediano prominentibus costis subbasalibus binis adscendentibus costis utrinque 3 prominentibus marginem versus arcuatis nerviis secundariis conspicuis parallelis horizontalis petiolis distinctis inflorescentiis glomerulatis sessilibus axillaribus floribus dense pilosis.

TYPUS: *Brass 12802* (L).

Slender tree, 4—8 m high, 6 cm in diam.; branchlets slender, cylindrical, the young ones densely rusty tomentose. Leaves alternate, thin, papery, subovate-elliptical, 2 X 6.5—4 x 10 cm, caudate-acuminate, tip sharp, base shortly acute, both surfaces (high power lens) densely reticulate; young leaves very densely, rusty adpressed pilose; adult leaves on the upper surface glabrous (except the sunken main nerves); lower surface glaucous (fresh), main nerves densely tomentose, midrib prominent, two subbasal nerves prominent, ascending to 2/3 of the leafblade length; lateral nerves 3(—4) pairs, rather erect and ascendent, slightly arcuate, prominent, secondary nerves prominulous, parallel, horizontal, rather lax. Petiole slender, densely tomentellous, 5—10 mm long. Inflorescences glomerulate, sessile, axillary; flowers yellowish, densely adpressed pilose; fruit blue-black, ellipsoid to subglobular, 3—5 mm diam., apiculate, smooth, seated

on a shallow cupule, surrounded by the remnants of the perianth, peduncle slightly obconical, 5 mm, pilose.

Litsea barringtonioides Kosterm., *spec. nov.*

Arbor mediocris ramulis crassis griseis glabris foliis chartaceis glabris subverticillatis spathulatis magnis obtusis basi auriculatis supra plerumque laevia, nervo mediano lato piano vel subimpresso, costis gracilibus impressis subtus dense obscure reticulata nervo mediano valde prominentibus costis utrinque 20—25 subpatentibus strictis prominulis marginem versus arcuatis evanescentibus nerviis secundariis laxis prominulis petiolis brevis vel longis crassis inflorescentiis ramifloris racemiferis perdense minutissime adpresse pallide-brunneo pilosis brevis umbellis magnis breve pedunculatis fructus depresso-globosus apiculatus cupula subplana parva pedicello crasso.

TYPUS: *Kostermans 13261* (L).

Tree, 8—15 m; bark smooth, soft, pale brown or white, 1 mm thick; living bark 5—10 mm, pale dirty yellow or brownish; sapwood 2.5 cm, white; heartwood dirty yellow with cigarboxwood smell. Branchlets very thick with large leafscars and decurrent leaf spurs, starting from either side the petiole forming a characteristic pattern of angular, elongate-ovate

figures; endbud densely, minutely, adpressed pilose. Leaves subverticillate, chartaceous, glabrous (in young leaves, under high power lens some sparse minute, adpressed hairs on the lower surface), spatulate, 11 x 38—18 X 47 cm, top obtuse, base gradually acute and auricled; upper surface usually smooth, midrib flat or slightly impressed, lateral nerves slender, subimpressed; lower surface densely, minutely reticulate, midrib strongly prominent, lateral nerves 20—25 pairs, rather patent, slender, rather straight, near margin arcuate, secondary nerves prominulous, laxly reticulate. Petioles thick, 5—40 mm long. Inflorescences on the branches, densely, minutely pale brown, adpressed pilose, racemiform, main peduncle up to 2.5 cm long bearing the shortly peduncled (3 mm), large (1 cm diam.) umbels; florets tomentose; stamens small, filaments slender, long, tomentose. Fruit depressed globose, up to 2 cm diam., 12 mm high, above flattened with a marked point; cup thick, small, shallow, 10—12 mm diam. at apex, merging into a thick, 10—15 mm long, crusty, brown pedicel.

Litsea casearioides Kosterm., *spec. nov.*

Arbor in omnibus partibus glabris foliis junioribus inflorescentiis exceptis ramulis cylindricis laevibus vel striatis foliis alternantibus chartaceis ellipticis breve acuminatis basi rotundatis vel subcordatis supra obscure dense parallele reticulatis nervo mediano prominulo basin versus impressis costis filiformibus subtus sublaevia nervo mediano prominulo costis utrinque 13—18 prominulis erecto-patentibus substrictis marginem versus arcuatis foliis perjunioribus dense minutissime adpresse pulverulente pilosis petiolis brevis canaliculatis inflorescentiis brevissimis axillaribus dense minutissime adpresse pilosis griseis pedunculis umbellatis gracilibus glomeratis.

TYPUS: *SAN 19047* (L).

Tree, 12—19 m high, diam. up to 12 cm; bark smooth, flaky, 0.5 mm; living bark 5 mm, light brown or pink, soft; cambium grey; sapwood white. Branchlets longitudinally striate, glossy, rather slender. Leaves spirally arranged, chartaceous, elliptical, shortly acuminate, base rounded or subcordate; upper surface smooth or with a dense parallel pattern of secondary nerves, midrib prominulous, at base impressed, ribs filiformous, lower surface rather smooth, midrib prominulous, lateral nerves 13—18 pairs, prominulous, erect-patent, rather straight, arcuate towards margin. The unfolded leaves of the flush densely, minutely, pulverulently, adpressed pilose; this pilosity sometimes found on the main nerves of the lower surface of young leaves. Petioles up to 12 mm long, narrowly channeled

above. Inflorescences short, axillary, densely, minutely pulverulently, adpressed, grey pilose; peduncles (immature) slender, up to 5 mm long, clustered.

***Litsea meyeri* Kosterm., spec. nov.**

Arbor parva vel frutex ramulis apicem versus minutissime dense rufo sublanuginosis ramis gracilibus glabris griseis laevibus foliis alternantibus glabris chartaceis anguste ellipticis vel anguste subobovato-ellipticis distincte acuminatis basi longe cuneatis utrinque (supra obscure) dense prominule reticulatis supra nervo mediano costisque filiformibus subplanis subtus nervo mediano prominulo costis utrinque 7—9 erecto-patentibus prominulis gracilibus subarcuatis petiolis longis gracilibus racemis axillaris perdense minute ferrugineo sublanuginosis saepe longis umbellis pedunculatis pedunculis ante anthesin bracteis angustis longis acutis basalibus.

TYPUS: *Meijer* 5081 (L).

Shrub or tree, up to 3 m high, bole 1 m, diam. 15 cm, outer bark roughish, 0.1 mm thick; inner bark light ochre; branchlets towards apex densely, minutely rusty sublanuginose; branches glabrous, rather slender, smooth, grey. Leaves spirally arranged, glabrous, chartaceous, narrowly elliptical to narrowly subobovate-elliptical, 3.5 x 12—4.5 x 19 cm, apex acuminate with sharp tip, base long-cuneate; both surfaces (above rather obscurely), densely, prominulously reticulate; upper surface with flat midrib and filiform ribs; lower surface pale, midrib prominent, lateral nerves 7—9 pairs, erect-patent, prominent, slightly curved (the apical ones more and all more towards the margin). Petioles glabrous, slender, slightly thicker towards base, 2—3 cm long. Racemes of umbels axillary, densely, minutely, rusty lanuginose, 3—16 cm long, the umbels dropping after anthesis, hence only young ones present near the apex of the racemes (male ones); umbel peduncles up to 5 mm long; expanded umbel up to 7 mm diam.; bracts ovate, acutish, 3.5 mm long; florets densely, minutely adpressed pilose; umbel peduncles before anthesis subtended by narrowly lanceolate, densely adpressed pilose, acute (subsubulate), up to 8 mm long bracts.

Named after Dr. Willem Meijer, the well-known plant collector, who — as a lecturer in botany of the University at Pajakumbuh, Sumatra — set up a Herbarium and explored Mt. Sago intensively.

B. 3826* (K, L).

***Litsea rubicunda* Kosterm., spec. nov.**

Arbor parva in omnibus partibus glabra (inflorescentiis exceptis) ramis griseis cylindricis striatis ramulis subgracilis laevis in sicco rubris foliis alternantibus membranaceo-chartaceis in sicco rubris anguste ellipticis vel subobovato-ellipticis vel ellipticis acuminatis acumine gracilibus basi acutis utrinque obscure laxe prominule reticulatis vel supra laevia, nervo mediano supra impresso costis filiformibus prominulis subtus pallidiora nervo mediano prominentibus costis utrinque 6—11 erecto-patentibus arcuatis gracilis prominulis petiolis gracilis longis supra anguste canaliculatis umbellis pedunculorum gracilis longis racemis brevissimis axillari-bus parce minutissime pulverulente pilosis impositis fructus depresso globoso apiculatus cupula parva plana margine undulata pedicellis longis vix incrassatis.

TYPUS: *Bias Paie S. 19262* (L).

Small tree, 2—10 m, glabrous in all its parts (except the inflorescence); bark smooth, light brown; wood pale yellow; branches grey, finely, longitudinally striate; branchlets rather slender, smooth, dirty red (in sicco). Leaves spirally arranged, reddish (in sicco), thinly chartaceous, narrowly elliptical to narrowly subobovate-elliptical or elliptical, 4.5 X 16—6.5 X 29—8 X 26 cm, apex acuminate (acumen usually slender, acute), base acute, both surfaces rather obscurely, laxly, prominulously reticulate (or upper surface smooth); upper surface with impressed midrib and filiformous, prominulous ribs; lower surface with prominent midrib; lateral nerves 6—11 pairs, slender, erect-patent, arcuate, prominulous. Petioles slender, 2—3.5 cm long, narrowly channeled above. Inflorescences axillary, laxly, very minutely, pulverulently pilose, consisting of a short, 0.5 mm long raceme, bearing the umbels on up to 5 mm long peduncles. Expanded umbel ca 1 cm diam., outer bracts glabrous, inner ones minutely rusty adpressed pilose; filaments (male flower) long, slender, slightly pilose. Fruit depressed globular, smooth, apiculate, 10 x 17 mm; cup shallow, thin, 5—8 mm diam., margin undulate; pedicel slightly thickened, 6—10 mm long.

SARAWAK. Simpang Tiga, Ulu Mayeng, Kakus, basalt derived soil, river bank, Oct., fr., *Ilias Paie S. 19262* (A, BO, K, KEP, MEL, SAN, SING), fr. white; Kapit Distr., bank of Rejang R., 10 km below Belag'a, alt. below 500 m, sandstone, Aug., fl., *Jacobs 5309* (B, CANB, K, L, SAN, SAR), male flowers, involucre pale green, tepals pale yellow with green tips, filaments white; Sg\ Tail, Sana, alt. 100 m, May, fl., *Purseglove P 5131* (L, SING). Litsea rufo-fusca Kosterm., *spec. nov.*

Arbor ramulis strictis perdense minutissime atro-rubro sublanuginosis foliis rigide coriaceis subovato-ellipticis acutis basi in petiolum contractis breve cuneatis supra nitida glabra nervo mediano costique impressis subtus dense atro-rubro sublanuginosis nervo mediano valde prominentibus costis utrinque 6—8 erecto-patentibus arcuatis prominentibus nerviis secundariis prominulis parallelis connectis reticulatio dense prominulo petiolis longis dense atro-rubro sublanuginosis umbellulis dense minutissime atro-rubro lanuginosis pedunculis conspicuis ramulis brevissimis vel nullis axillaribus impositis fructus calycibus parvis semiglobosus fructus parvis ovoideus, acutus.

TYPUS: *bb 330U (L)*.

Tree, up to 12 m high, up to 30 cm in diam.; bark smooth, lightbrown, brittle, 0.5 mm thick; living bark 5 mm, palebrown or lightred, inner bark hard; wood white. The stiff branchlets, lower leaf surface, flowers and fruit cup densely, minutely, blackish redbrown sublanuginose; the flush completely covered with the same indumentum. Leaves spirally arranged, rigidly coriaceous, subovate-elliptical, 4.5 x 11—9 x 27 cm, acutish, base contracted into the petiole, shortly cuneate (in the narrower leaves acute); upper surface smooth, glossy, glabrous, midrib and primary nerves impressed; lower surface with strongly prominent midrib, lateral nerves 6—8 pairs, erect-patent, arcuate, prominent, connected by the pronervulose, parallel, numerous secondary nerves, in between a dense, prominulous reticulation, the leafblade glaucous. Petioles 1.5—3 cm long, densely sublanuginose, glabrescent. Umbels (expanded ca 7 mm diam.) on up to 1 cm long peduncles and these on 0—1 cm long, short branchlets in the leaf axils; florets tomentose; filaments slender, long, tomentose; fruit cupule semi-globose, 5 mm diam. at the thin rim, 3—4 mm deep on an up to 5 mm long pedicel; fruit (immature) slender, ovoid, acute 3 x 7 mm.

DISTRIBUTION: Borneo, peat swamp forest.

Litsea staintonii Kosterm., *spec. nov.*

Arbor parvis ramulis gracilibus pallide rubro-brunneis glabris nitidis innovatione minutissime dense rufo sericeis foliis alternantibus membranaceo-chartaceis ellipticis conspicue acuminatis basi cuneatis supra laevia

glabra nerviis principalis subimpressis subtus perdense minutissime aureo sericeis nervo mediano prominentibus costis graciles utrinque 5—6 erecto-patentibus subarcuatis reticulatio laxe prominulo petiolis longis glabrescentibus supra parte apicale canaliculatis umbellulis dense minutissime aureo sericeis glabrescentibus pedunculis gracilibus longis sericeis impositis axillarum foliorum ramulis brevissimis impositis.

TYPUS: *Chew, Corner & Stainton 244 (K)*.

Tree, 10—13 m high, diam. 60 cm; bark very smooth, grey; branchlets rather slender, pinkish brown, glabrous, smooth; endbud densely, minutely rufo-sericeous. Leaves spirally arranged, thinly chartaceous, elliptical, 5 X 11—7 x 16 cm, acuminate (acumen 1—1.5 cm), base cuneate; upper surface smooth, glabrous, midrib and ribs slightly impressed; lower surface very densely, minutely golden brown sericeous, midrib prominent, lateral nerves slender, 5—6 pairs, prominulous, slightly arcuate, reticulation lax, prominulous. Petioles slender, glabrous, 12—20 mm, upper part partly slitlike channeled. The densely, minutely sericeous, glabrescent umbels on densely sericeous, 1—1.5 cm long, slender peduncles and these on axillary short, densely sericeous, 1—12 mm long young branchlets, usually several on one branchlet; bracts orbicular, up to 4 mm; ovary glabrous with a short style and broadened, truncate stigma.

SABAH. Mt. Kinabalu, E. shoulder, alt. 1000 m, July, female fl., *Chew, Corner & Stainton 2H (K)*; *ibid.*, alt. 800 m, June, buds, *Chew, Corner & Stainton 119 (K)*.

Litsea teschneri Kosterm., *nom. nov.*

Tetradenia novo-guinensis Teschner (base) in Engl. bot. Jahrb. 58: 393. 1923; cf. Kostermans, *Bibl.* 1370 no 39. — *Neolitsea novo-guinensis* (Teschner) Merr.; cf. Kostermans, *I.e.* 1045 no 68. — Typos: *Leder mann 9579 (L)*.

Litsea turfosa Kosterm., *spec. nov.*

Arbor ramulis perdense minutissime rufo lanuginosis foliis alternantibus chartaceis ad coriaceis oblongis vel obovato-oblongis obtusis basi acutis supra glabra nitida laevia, nervo mediano impresso costis filiformibus subimpressis subtus perdense minutissime rufo-lanuginosa nervo mediano prominentibus costis utrinque 5—7 gracilis erecto-patentibus arcuatis nerviis secundariis parallelis laxis obscuris vel deest foliis adultis saepe glabrescentibus subtus glaucis petiolis longis inflorescentiis axillaribus brevissimis perdense minutissime rufo-lanuginosis umbellulis pedunculorum longis.

TYPUS: *SAN U550 (K)*.

Tree, up to 27 m high, with 17 m free bole, 30 cm diam., usually much smaller; bark white, smooth (rarely brown) with small round lenticels, outer bark thin, brittle, brown, 0.2 mm; inner bark orange (or white yellow-mottled), brittle; sapwood lemon yellow, cambium yellow, soft, 0.6—2.5 mm. Branchlets rather slender, cylindrical, densely, minutely fer-

rugineously lanuginose. Leaves spirally arranged, chartaceous to coriaceous, oblong, rarely obovate-oblong, 3 x 6—8 x 16 cm, rarely lanceolate, obtuse or rarely very shortly, obtusely acuminate, base cuneate or acute; upper surface glossy, smooth, midrib impressed, lateral nerves filiformous, slightly impressed, lower surface in young leaves densely, minutely, rufo-lanuginose, glabrescent (except on the main nerves), the adult leaves often smooth, glaucous underneath, midrib prominent, lateral nerves 5—6(—7) pairs, slender, prominent, erect-patent, slightly arcuate; secondary nerves lax, faint, parallel or none. Petioles densely, minutely rusty lanuginose, up to 2 cm long, narrowly channeled above. Inflorescences axillary, densely, minutely, rusty lanuginose, 2—3 mm long, bearing the up to 15 mm long peduncled umbels; open umbels 6—8 mm in diam.

DISTRIBUTION: peat-swamp forest in Borneo.

The species belongs to the *L. castanea* group; according to Ashton it is a striking tree because of the magenta colour of the crown, the smooth, pale grey, almost white bark with small, round lenticels.

SARAWAK. Kuching, Febr., buds, *Haviland & Hose 218-0* (L), leaves up to 7.5 x 11 cm; Bako Nat. Laurus gewmdflora Reinw. ex Blume (nomen); cf. Kostermans, I.e. 628 no 156b (non 156a). — Typus: *Reinwardt* 831 (L), "Huru hiries", Java, fl. (in Leiden the number 831 appears also on one type sheet of *Ocotea declinata* BL, marked "Huru leu-ur", Salak, Dec. 1822).

Persea rimosa Zoll. ex Meissn. (non *Machilus riinosa* Bl.); cf. Kostermans, I.e. 1253 no 250, quoad *Zollinger* 13484 (L).

THE HYPHOMYCETE GENUS DACTYLARIA SACC.

MIEN A. RIFAI *)

SUMMARY

An emended delimitation of the genus *Dactylaria* Sacc. is proposed and the two accepted species, which are non-predaceous and dematiaceous, are redescribed and illustrated. The affinity of many nematode-trapping species currently classified in *Dactylaria* with the didymosporous genera *Arthrobotrys* Corda, *Candelabrella* Rifai & R. C. Cooke and *Genicularia*, Rifai & R. C. Cooke is discussed and the scopes of the latter genera are enlarged, and consequently several new combinations are made.

INTRODUCTION

In an earlier attempt to find the appropriate genera for some species of didymosporous nematode-trapping Hyphomycetes of the *Trichothecium-Arthrobotrys* complex (Rifai & Cooke, 1966), several phragmosporous genera have been seriously considered. Of these the genus *Dactylaria* Sacc. has received a special attention, especially because Soprunov (1958) transferred *Arthrobotrys dactyloides* Drechsler (1937) to it. This disposition was tentatively rejected by Rifai & Cooke (1966) because they believed that the affinity of *A. dactyloides* with *A. superba* Corda, the type species of the genus *Arthrobotrys* Corda, was sufficiently close to warrant their inclusion in one genus. They further pointed out that the limits of the genus *Dactylaria* was not yet fully understood. The result of the subsequent study on the taxonomy of *Dactylaria* reported below does not only prove that the retention of *A. dactyloides* in *Arthrobotrys* is fully justified, but also shows that the majority of species now included in *Dactylaria* cannot be retained in this genus any longer.

In 1877 Saccardo described and illustrated *Acrothecium purpurellum* Sacc, a purplish phragmosporous hyphomycete which was found growing saprophytically on a piece of decayed *Quercus* wood in Italy. Based on this species the new genus *Dactylaria* was created by Saccardo (1880) three years later, which he described as follows: "..... Saprophila. Hyphae fertiles erectae, simplices, apice capitulum conidiorum gerentes; conidia fusioidea v. clavulata, 2-pluriseptata....." In compiling the fourth
