

Berrya ameliae (Lundell) Kosterm., *comb. nov.*; basionym: *Carpodiptera ameliae* Lundell in Field and Lab. 6: 13. 1937.

Berrya boivinii (Baillon) Kosterm., *comb. nov.*; basionym: *Carpodiptera boivinii* Baillon, Adansonia 10: 180. 1872.

Berrya cubensis (Gris.) Kosterm., *comb. nov.*; basionym: *Carpodiptera cubensis* Grisebach in Mem. Am. Acad. N.S. 8: 164. 1861.

Berrya floribunda (Urban) Kosterm., *comb. nov.*; basionym: *Carpodiptera floribunda* Urban, Symb. Antill. 5: 412. 1908.

Berrya hexaptera (Urban & Ekm.) Kosterm., *comb. nov.*; basionym: *Carpodiptera hexaptera* Urban & Ekman in Arkiv. Bot. Stockh. 20A (15) : 76. 1926.

Berrya mariarum (Standley) Kosterm., *comb. nov.*; basionym: *Carpodiptera mariarum*, Standley in Publ. Field. Mus. Nat. Hist. Chicago, Bot. Ser. 23: 126. 1944.

Berrya sansibarensis (Burr.) Kosterm., *comb. nov.*; basionym: *Carpodiptera sansibarensis* Burret in Notizbl. bot. Gart. Berlin-Dahlem 9: 607. 1926.

Berrya simonis (Urb.) Kosterm., *comb. nov.*; basionym: *Carpodiptera simonds* Urban, Symb. Antill. 6: 16. 1909.

I suspect that *Tahitia* Burret (l.e. 609), based on *Berrya vescoana* Baillon and created by Burret on the strength of the description of Baillon and a plate of Drake del Castillo, should also be included in *Berrya*; the differences with *Berrya*, as stated by Burret are very small indeed and do not merit to be evaluated as being on the generic level. Without proper material at hand, however, I prefer to defer a final decision.

KAYEA Wall, and MESUA L. (Guttiferae)

A. J. G. H. KOSTERMANS *

Kayea Wallich, Pl. As. rar. 3: 5. 1832 and *Mesua* L., Spec. Pl. 515. 1753 are very closely related.

Bentham and Hooker (Gen. Pl. 1: 176. 1862) distinguished both genera in this way, that *Kayea* has a one-celled ovary with one seed and a 4-fid style, whereas *Mesua* has a 2-celled ovary and 4 ovules, the stigma being peltate.

This distinction has been maintained by other botanists, but Anderson (in Hooker f., Fl. Brit. Ind. 1: 259. 1874) encountered already a difficulty with the species *M. lepidota* Anders., which as he says: "might represent a new genus in between *Kayea* and *Mesua*", bringing the two still closer together.

Some years ago I started to revise *Kayea* and *Mesua* in conjunction with my monograph on *Mammea* L. (including *Ochrocarpus*). Lack of adequate material of several species compelled me to postpone the final revision, until such materials should be available.

Meanwhile it has become clear that the two genera cannot be separated. Collections from living *Mesua ferrea* trees in the Botanic Garden in Bogor, proved that on the same tree of *Mesua ferrea* L. two- and one-celled fruit may be found with one or two seeds.

In other *Kayea* species two-seeded fruit were observed.

The shape of the stigma cannot be used as a generic characteristic as between the peltate one of *Mesua ferrea* (which sometimes is ineised) and the more or less 4-fid ones of *Kayea* there are all gradations.

As in all other respects the two genera are completely alike, I had decided long ago to merge them under *Mesua*.

As I have been pressed to publish the new combinations, which I have written on the herbarium labels in many herbaria, I herewith give a list of the new combinations, in anticipation of the forthcoming monographic revision.

34. *Mesua planigemma* Kosterm., *spec. nov.* — Fig. 1.

Arbor in omnibus partibus glabris ramulis graeilis stipulis acieumt& minutis foltisk chartaceis ellipticis vel suboblancoelato-elUpticis acuminatis basi breve acutis utrinque nitidis supra nervo mediano costisque

filiformibus prominulo-subimpressis subtus nervo mediano gradle prominente costis utrinque 12-17 filiformibus prominulis subpatentibus petiolis graeilis inflorescentiis axillaris pedunculis longis gradlis gemmulis bracteis planis magnis suffultis stigmatate peltato quadmgulare obscure b-partitis.

Typus: *San24969*(BO)

Tree 12 m high, free bole 8 m, diam. 30 cm. Bark soft, 3 mm thick; inner bark purple, soft; sapwood yellow; all parts glabrous. Branchlets very slender. Leaves chartaceous, subobovate- or oblanceolate-elliptical to elliptical, 3 x 9 - 6 x 16 cm, abruptly acuminate (acumen up to 1 cm), base shortly acute, both surfaces glossy, upper one with filiformous midrib and lateral nerves, prominulous (sometimes in a groove); lower one with slender, prominent midrib, lateral nerves filiformous, 12-17 pairs (with shorter ones in between), rather patent, reticulation dense, minute, faint, Petioles very slender, 6 - 10 mm long.

Inflorescences few-flowered, axillary near the apex of the branchlets; main peduncle slender, 1.5 - 5 cm long, thickened towards the apex, which bears 2 - 3, 0.5 - 1.5 cm long branchlets, each topped with one flower. The flower completely covered by enormous flat, ovate, acute glaucous bracts, up to 5 x 18mm; the two bracts forming a flat "bud" with a central bulge; petals 5mm, broadly obovate to fan-shaped; stamens numerous, 9 mm long; ovary elongate, merging into a thick, as long style (together 2 mm long) with a thick, cushion-like stigma, obscurely divided into 4 parts.

The flowers are indicated as white, these are presumably the large bracts.
