AN UPDATED SURVEY OF MALESIAN SEED PLANTS FAMILIES

Received April 29, 2010; accepted September 6, 2010

M.M.J. VAN BALGOOY

NCB Naturalis, Netherlands Centre for Biodiversity Naturalis (section NHN), Leiden University, P.O. Box 9514, 2300 RA Leiden, The Netherlands.

ABSTRACT

VAN BALGOOY,M.M.J. 2010. An updated survey of Malesian Seed Plants Families. *Reinwardtia* 13(2): 171–181. — The conservative family concept has been adopted on the Malesian Seed Plants Families I – III to show the visible characters to help identify specimen herbarium of the Malesian Plants. During a new classification of orders and families of flowering plants based on the molecular data has been leaded, some changes in family delimitation have occurred. By providing this family survey, the users of Malesian Seed Plants book can place their taxa in the correct family.

Key words: Malesian, Seed Plants, family, survey.

ABSTRAK

VAN BALGOOY,M. M. J. 2010. Survai pembaruan buku Malesian Seed Plants. *Reinwardtia* 13(2):171–181. — Konsep suku yang konservatif digunakan dalam buku “Malesian Seed Plants Families I – III” untuk menunjukkan ciri yang mudah dilihat untuk membantu mengidentifikasi specimen herbarium untuk tumbuhan dari kawasan Malesia. Selama klassifikasi baru untuk bangsa dan suku dari tumbuhan berbunga yang didasarkan pada data molekular digunakan, beberapa perubahan dalam batasan suku terjadi. Dengan mengadakan survai suku ini, pengguna buku *Malesian Seed Plants* dapat meletakkan taksanya dalam suku yang betul.

Kata kunci: Malesian, Seed Plants, famili, survai.

INTRODUCTION

In my handbooks for recognition of Malesian Seed plants (Van Balgooy 1997, 1998, 2001) I adopted a conservative family concept. These publications were mainly intended to help identify herbarium material of Malesian plants by means of characters visible with some training, experience and perseverance. Apparently these books fill a need and I have been assured from various sides that they are frequently being consulted. A CD version (Malesian Key Group, 2004) does not seem to enjoy the same popularity.

Recent molecular research has resulted in a new classification of orders and families of flowering plants (Mabberley 2008, Chase 2009). Some of the changes in family delimitation were expected on morphological grounds. Examples: the inclusion of *Asclepiadaceae* in *Apocynaceae*, the transfer of many *Verbenaceae* genera to the *Lamiaceae*, and the merging of *Bombacaceae*, *Malvaceae*, *Sterculiaceae* and *Tiliaceae* into a single family *Malvaceae*. As could be predicted the *Liliaceae* and *Saxifragaceae* have been dismembered. However, some of the changes are not so evident from a morphological viewpoint such as the inclusion of many *Flacourtiaceae* genera in the *Salicaceae*, the

complete overhaul of the *Scrophulariaceae* and the removal of *Calophyllum* from the *Clusiaceae*.

In writing this update Mabberley's Plantbook was indispensable (Mabberley o.c.). New insights provided by the Angiosperm Phylogeny Group (Chase o.c.) have also been incorporated. The last word in family classification is far from being said. Continued molecular research will no doubt lead to new family arrangements. By providing this survey I can do no more than provide a snapshot of current views, thus enabling users of my books to place their taxa in the “correct” family.

In the family survey the number preceding the family name refers to the comments following the survey. The number following the family name indicates the number of genera in the family represented in Malesia by indigenous species. This figure is largely based on the checklist by Van Steenis (1987). The figure in brackets is the number of naturalized genera. An asterix (*) before a name means that the family was not recognized in my seed plant books. The name in brackets following a name indicates the family upon which the new family is based. Examples: **Achariaceae* (*Flacourtiaceae p.p.*) means that the new family *Achariaceae* contains part of the genera formerly placed in *Flacourtiaceae*. A family no longer

recognized is indicated by "see". Example: *Flacourtiaceae* see *Achariaceae* and *Salicaceae*. A family name in brackets is an alternative name e.g. *Poaceae* (*Graminae*). It can also mean that the family in brackets was considered distinct in my books. Example *Amaranthaceae* (*Chenopodiaceae*). An arrow (↑) following a name means that the

family is represented in Malesia by naturalized species e.g. *Cactaceae* of which some species have firmly established themselves in the vegetation. Families represented only by cultivated non-naturalized species have not been included, e.g. *Caricaceae*. A family or genus represented by both naturalized and native species is considered native.

Family survey

Notes	Family	Naturalized Genera	Number of native Genera
1	<i>Acanthaceae</i> (<i>Verbenaceae pp.</i> , <i>Avicennia</i>)	(5)	40
54	<i>Aceraceae</i> see <i>Sapindaceae</i>		
2 *	<i>Achariaceae</i> (<i>Flacourtiaceae p.p.</i>)		7
3 *	<i>Acoraceae</i> (<i>Araceae p.p.</i>)		1

In his checklist Van Steenis recognized 239 families of which 23 only were represented by naturalized or cultivated species, thus accepting 216 native families. In my plant books I adopted a slightly less conservative family concept and accepted 235 families of which 8 only are represented by naturalized species. In the present survey there are 255 indigenous and 10 naturalized families. Van Steenis listed 2382 genera with indigenous species, whereas in the present survey 2403 genera are accepted and 191 genera only represented by naturalized species..

Notes

- 1 *Avicennia*, now placed in *Acanthaceae* (formerly in *Verbenaceae* or in *Avicenniaceae*) differs from the rest of the family by the following features: mangrove trees with breathing roots, no cystoliths, viviparous.
- 2 *Achariaceae* split off from *Flacourtiaceae* accommodates the following genera: *Eleutherandra*, *Erythrospermum*, *Hydnocarpus*, *Pangium*, *Ryparosa*, *Scaphocalyx* and *Trichadenia*. See also notes 30 and 52.
- 3 *Acorus* is removed from *Araceae*, recognizable by its Iris like leaves. See also note 10.
- 4 *Altingia*, removed from *Hamamelidaceae* is placed in a monospecific family.
- 5 *Amaranthaceae* now harbours the genera formerly in *Chenopodiaceae*.
- 6 *Allium* ↑ treated as *Liliaceae* in Mal. Seed Pl. is now in *Amaryllidaceae*.
- 7 *Anisophyllea* and *Combretocarpus* are placed in a separate family from *Rhizophoraceae* as was expected. The leaves are alternate in *Anisophyllaceae* and opposite in *Rhizophoraceae*.
- 8 *Mackinlaya*, formerly in *Araliaceae*, has been moved to *Apiaceae*.
- 9 As could be predicted *Apocynaceae* now

- includes the *Asclepiadaceae*.
- 10 *Acorus* has been removed from the *Araceae* but the *Lemnaceae* are added.
 - 11 *Aralidium*, placed with some doubt in *Araliaceae*, is now in a separate family. *Mackinlaya* is now in *Apiaceae* and *Delarbrea* is now in a separate family, *Myodocarpaceae*.
 - 12 *Asparagaceae* now accommodates some genera formerly placed in other families: *Cordyline* and *Dracaena* (ex *Agavaceae*), *Arthropodium*, *Asparagus*, *Chlorophytum*, *Disporopsis*, *Liriope*, *Ophiopogon*, *Peliosanthes*, *Thysanotus* and *Tupistra* (ex *Liliaceae*).
 - 13 *Astelia*, formerly in *Liliaceae*, is now in *Asteliaceae*.
 - 14 *Atherospermataceae* now harbours *Dryadodaphne* (ex *Monimiaceae*)
 - 15 Next to the cultivated *Bixa*, the *Bixaceae* now harbours *Cochlospermum*.
 - 16 *Ploiarium*, formerly in *Theaceae*, is now in *Bonnetiaceae* as has been suggested before.
 - 17 *Hydrophyllaceae* has been reduced to *Boraginaceae*, but the sole representative of the family in Malesia, *Hydrolea*, has been placed in a separate family. The aberrant genus *Pteleocarpa* is retained in *Boraginaceae*.
 - 18 *Cannabaceae*, so far only represented by the cultivated *Cannabis*, has been expanded to include several genera formerly in *Ulmaceae*: *Aphananthe*, *Celtis*, *Gironniera*, *Parasponia* and *Trema*. See also note 62.
 - 19 *Caprifoliaceae* now also harbours *Triplostegia* (ex *Dipsacaceae*) and *Valeriana* (ex *Valerianaceae*) but *Carlemannia* is placed in a separate family.
 - 20 *Bhesa*, easily recognized within the *Celastraceae* by its bipulvinate petiole and scalariform venation is placed in a separate family (*Centroplacaceae*). *Stackhousia* (*Stack-*

- housiaceae*) and *Parnassia* (formerly *Saxifragaceae*) have been added to the *Celastraceae*.
- 21 *Calophyllum* is removed from *Clusiaceae*.
- 22 *Colchicaceae* accommodates part of the former *Liliaceae*: *Disporum*, *Gloriosa*, *Iphigenia* and *Schellhammera*. See also note 36.
- 23 *Cornaceae*, apart from *Mastixia*, now also harbours *Alangium* (*Alangiaceae*) and *Nyssa* (*Nyssaceae*).
- 24 *Ctenolophon*, uncomfortably lodged in *Linaceae* is now in a family of its own. See also note 37.
- 25 *Epacridaceae* has been sunk in *Ericaceae*, but can easily be told apart by the very close longitudinal venation.
- 26 *Erythropalum*, as expected is removed from *Olacaceae*, and is rather unexpectedly joined by *Scorodocarpus* and *Strombosia*, in a separate family.
- 27 *Polyosma* (ex *Saxifragaceae*) is the sole representative of the *Escalloniaceae* in Malesia. See also note 55.
- 28 *Euphorbiaceae* has always been a notoriously difficult family. During pre-identification sessions, whenever coming across an unknown specimen I used to say mockingly: "If in doubt say *Euphorbiaceae*". More often than once the guess proved to be correct. The removal of several genera to other families makes the family slightly less heterogeneous.
- Pandaceae*: *Galearia*, *Microdesmis*.
- Phyllanthaceae*: *Actephila*, *Antidesma*, *Aporosa*, *Baccaurea*, *Bischofia*, *Breynia*, *Bridelia*, *Dicoelia*, *Distichilops*, *Cleistanthus*, *Flueggea*, *Glochidion*, *Hymenocardia*, *Lepidotus*, *Margaritaria*, *Nothobaccaurea*, *Phyllanthus* and *Sauvagesia*.
- Picrodendraceae*: *Austrobuxus*, *Choriceras*, *Kairothamnus* and *Petalostigma*
- Putranjivaceae*: *Drypetes*.
- 29 As has been suggested before *Nothofagus* is removed from *Fagaceae*.
- 30 *Flacourtiaceae* has ceased to exist. *Flacourtia*, along with most other genera, has been transferred to *Salicaceae*, seven have moved to *Achariacea*. See note 2. *Paropsia* now belongs to the *Passifloraceae*.
- 31 *Gelsemium* is removed from *Loganiaceae*. See also note 38.
- 32 *Gunnera* as has often been suggested before has been removed from *Haloragaceae*.
- 33 After moving from one family to another, *Hanguana* is now placed in a family of its own.
- 34 *Stemonurus*, formerly in *Icacinaceae*, is now in a separate family.
- 35 *Ixonanthaceae* split off from *Linaceae* also harbours *Allanthospermum*, formerly in *Simaroubaceae*.
- 36 *Liliaceae* has always been a catchall for doubtfully related genera. The genera accepted as belonging in this family in Mal. Seed Pl. are now placed as follows:
- Asparagaceae*, see note 12
 - Asteliaceae*, see note 13
 - Colchicaceae*, see note 22
 - Narthesiaceae*: *Aletris*
 - Xanthorrhoeaceae*, see note 65.
- 37 *Linaceae* is represented by *Hugonia*, *Indorouchera* and *Philbornea*. See notes 24 and 35.
- 38 Several genera removed from *Loganiaceae* are back in the family, but *Buddleja* is now in *Scrophulariaceae* (see note 56) and *Gelsemium* in *Gelsemiaceae*. See note 31.
- 39 *Lythraceae* now includes the widely different *Sonneratiaceae* and *Trapaceae*.
- 40 All genera of the family in Malesia have been reduced to a single genus, *Magnolia*.
- 41 The enlarged family *Malvaceae* now comprises four families which have always been difficult to tell apart. On the other hand it has also been suggested to recognize ten families instead of one.
- 42 *Delarbrea* is now in a separate family. See also note 11.
- 43 Similarly *Nothofagus* has been removed from the *Fagaceae*.
- 44 *Erythropalaceae* (see note 26) and *Schoepfiaceae* (*Schoepfia*) have been split off from *Olacaceae*.
- 45 The Malesian genera of this new family are *Quintinia* (ex *Saxifragaceae*) and *Sphenostemon* (ex *Sphenostemonaceae*).
- 46 *Ternstroemia* (ex *Theaceae*) is now in *Pentaphyllacaceae*.
- 47 *Eustrephus* is the only genus in *Philesiaceae*. *Geitonoplesium* has been moved to *Xanthorrhoeaceae*.
- 48 *Plantaginaceae* now harbours several genera formerly placed in other families: *Callitricha* (*Callitrichaceae*), *Bacopa*, *Brookea*, *Detzneria*, *Limnophila*, *Parahebe* and *Veronica* (*Scrophulariaceae*). See also note 56.
- 49 *Cymodoceaceae*, *Ruppiaceae* and *Zosteraceae* have been split off from *Potamogetonaceae*, which now only harbours *Potamogeton* and *Zannichelia*.
- 50 *Myrsinaceae*, including *Maesa*, have been sunk in *Primulaceae*.
- 51 *Carpodetus* (ex *Saxifragaceae*) is placed in a separate family *Rousseaceae*. See also note 55.
- 52 *Salicaceae* has been considerably enlarged by

- Scyphostegia (Scyphostegiaceae) and the inclusion of most genera formerly in Flacourtiaceae. See also note 2.
- 53 Viscaceae is now part of the Santalaceae.
- 54 Acer now placed in the Sapindaceae can easily be distinguished from the rest of the family by its opposite leaves.
- 55 Dismemberment of the Saxifragaceae was to be expected. The only genus remaining in the family is *Astilbe*. The other genera have found other families:
Carpodetus (Rousseaceae)
Deutzia, *Dichroa* and *Hydrangea* (Hydrangeaceae)
Itea (Iteaceae)
Polyosma (Escalloniaceae)
Quintinia (Paracryphiaceae)
- 56 The only indigenous genera of Scrophulariaceae are *Buddleja* (formerly Loganiaceae) and *Myoporum* (formerly Myoporaceae). All other genera have been moved to other families:
Linderniaceae (i.e. *Microcarpaea*, *Picria* and *Torenia*)
Orobanchaceae (i.e. *Buchnera*, *Centranthera*, *Euphrasia* and *Striga*)
Paulowniaceae (*Wightia*)
Phrymaceae (*Mazus*, *Mimulus*)
Plantaginaceae see note 48.
- 57 As expected Simaroubaceae has also undergone changes:
Allantospermum is now in Ixonanthaceae, *Harrisonia* in Rutaceae, *Irvingia* in Irvingiaceae, *Suriana* in Surianaceae. The remaining 6 genera are retained in the family.
- 58 *Pentastemon* sunk into Stemonaceae can easily be distinguished from the rest of the family by being five-numerous instead of two-merous.
- 59 *Strelitzaceae* is only represented in Malesia by introduced species (*Ravenala* and *Strelitzea*). *Heliconia* is now in Heliconiaceae.
- 60 Some genera formerly in Theaceae have now moved to other families: *Ploiarium* to Bonnetiaceae, *Ternstroemia* to Pentaphylacaceae and *Tetramerista* to Tetrameristaceae.
- 61 *Tetrameles* (ex Daticaceae) is now in a separate family.
- 62 *Sparganium* despite completely different inflorescence is placed in Typhaceae.
- 63 Most genera formerly in Ulmaceae have been transferred to Cannabaceae. Only *Ulmus* remains. See note 18.
- 64 If *Phyla* is native in Malesia it is the only representative of the Verbenaceae. All indigenous genera formerly in Verbenaceae are now in Lamiaceae.
- 65 Leeaceae (only genus *Leea*) once split off from Vitaceae is now back in that family.
- 66 Xanthorrhoeaceae, formerly only represented in Malesia by *Lomandra* and *Romnaldia* has been expanded to include *Geitonoplesium* (ex Philesiaceae), *Caesia*, *Dianella* and *Tricoryne* (ex Liliaceae).

ACKNOWLEDGEMENTS

I would like to thank Mark Coode and Sandy Atkins for reading and correcting the original manuscript and the following persons for providing information on the numbers of indigenous genera in their respective families: Frits Adema (Fabaceae), Peter Boyce (Araceae), Sigrid Liede (Asclepiadaceae), David Middleton (Apocynaceae and Gesneriaceae), Mark Newman (Zingiberaceae), Ed de Vogel (Orchidaceae), Peter van Welzen (Euphorbiaceae s.l.), Elizabeth A. Widjaja and Jan-Frits Veldkamp (Poaceae) and Brigitte and Willem de Wilde (Cucurbitaceae). Last but not least I am grateful to Hanneke de Wolf for typing out the manuscript.

INSTRUCTION TO AUTHORS

Reinwardtia is a scientific journal on plant taxonomy, plant ecology, and ethnobotany. Manuscript intended for a publication should be written in English represent an article which has not been published in any other journal or proceedings. Every manuscript will be sent to two blind reviewers.

Two printed copies (on A4 paper) of the manuscript of not more than 200 pages together with an electronic copy prepared on Word Processor computer program using Time New Romance letter type and saved in Rich Text File must be submitted.

For the style of presentation, authors should follow the latest issue of *Reinwardtia* very closely. Title of the article should be followed by author's name and mailing address in one-paragraphed English abstract of not more than 250 words. Keywords should be given below each abstract. On a separated paper, author(s) should send the preferred running title of the article submitted.

Taxonomic identification key should be prepared using the aligned couplet type.

Strict adherence to the International Code of Botanical Nomenclature is observed, so that taxonomic and nomenclatural novelties should be clearly shown. Latin description for new taxon proposed should be provided and the herbaria where the type specimens area deposited should be presented in the long form that is name of taxon, author's name, year of publication, abbreviated journal or book title, volume, number and page.

Map, line drawing illustration, or photograph preferably should be prepared in landscape presentation to occupy two columns. Illustration must be submitted as original art accompanying, but separated from the manuscript. On electronic copy, the illustration should be saved in jpg or gif format at least 350 pixels. Legends or illustration must be submitted separately at the end of the manuscript.

Bibliography, list of literature cited or references follow the Harvard system.
